BID FORM

Pennies for Progress - Widening of US 21 Bypass and SC 51
Project # 1149-004 – Project ID 0042332

Submitted: _____, 2025

York County Government
6 South Congress Street
York, SC 29745

Sir or Madam:

The undersigned, as Bidder, hereby declares that the only person or persons interested in the Bid, as principal or principals, is or are named herein and that no other person than herein mentioned has any interest in the Bid of the Contract to which the work pertains; that this Bid is made without connection or arrangement with any other person, company, or parties making a bid or proposal and that the Bid is in all respects fair and made in good faith without collusion or fraud.

The Bidder further declares that he has examined the site of the Work and, through personal knowledge and experience and/or subsurface investigations, has fully satisfied himself in regard to all conditions pertaining to such site and he assumes full responsibility therefore; that he has examined the Drawings and Specifications for the Work and from his own experience or from professional advice that the Drawings and Specifications are sufficient for the Work to be done; that he has examined the other Contract Documents and all addenda relating thereto, and that he has satisfied himself fully, relative to all matters and conditions with respect to the Work to which this Bid pertains.

The Bidder proposes and agrees, if this Proposal is accepted, to contract with York County Government (OWNER) in the form of contract specified, to furnish all necessary materials, equipment, machinery, tools, apparatus, transportation and labor and to perform all work necessary to complete the Work specified in the Bid and other Contract Documents.

The Bidder further proposes and agrees to commence substantial work on this project within 15 days of a Notice to Proceed and agrees that the Work will be completed and ready for final payment **within 1095 days** of the Notice to Proceed.

The Bidder further agrees that the deductions for liquidated damages, as stated in the Agreement and General Conditions, constitute fixed, agreed, and liquidated damages to reimburse the OWNER for additional costs to the OWNER resulting from the Work not being completed within the time limit stated in the Contract Form. The liquidated damages shall be **$2,200.00** for each consecutive calendar day thereafter for the project completion. Additional liquidated damages shall be **$1,800.00** for each consecutive calendar day thereafter for the Gold Hill realignment with US 21 interim completion date of **June 30, 2026.**

The Bidder further understands and agrees that the work zone traffic control required to complete the work shall be fully included in the Bid and no additional compensation will be made by the OWNER, unless approved and agreed upon at the OWNER sole discretion.

The Bidder further agrees to execute a Contract and furnish satisfactory Performance and Indemnity and Payment Bonds, and the required Certificates of Insurance, within ten (10) consecutive calendar days after receipt of Notice of Award of the Contract, and the undersigned agrees that in case of failure on his part to execute the said Contract and Performance and Indemnity and Payment Bonds within the ten (10) consecutive calendar days after the award of the Contract, the Bid guarantee accompanying his Bid and the money payable thereon shall be paid to the OWNER as liquidation of damages sustained by the OWNER; otherwise, the Bid guarantee shall be returned to the undersigned after the Contract is signed and the Performance and Indemnity and Payment Bonds are filed.

Widening of US 21 and SC 51
BID SCHEDULE - ROADWAY

All work performed by the Contractor as essential to the completion of the intent of the Contract Documents shall be paid for in accordance with the Bid Schedule. No direct payment will be made for work performed which is not shown as a separate Bid Item. All costs shall be included in the various pay items in the Bid Schedule or an amount shown as Total Bid Amount for the work shown on the proposed project plans.

BID BOND

STATE OF SOUTH CAROLINA
COUNTY OF YORK

KNOW ALL MEN BY THESE PRESENTS, that _____

as Principal, and _____, as Surety, a Corporation chartered and existing under the laws of the State of _____, with its principal offices in the City of_____, and authorized to do business in the State of South Carolina are held and firmly bound unto the OWNER, _____

_____ in the penal Sum of _____

_____Dollars ($_____) lawful money of the United States, for the payment of which sum will and truly to be made, we bind ourselves, our heirs, executors, administrators, and successors, jointly and severally, firmly by these presents.

THE CONDITION OF THIS OBLIGATION IS SUCH, that whereas the Principal has submitted to the OWNER the accompanying bid, dated _____***, 2025***, for:

York County No 11149-004 SCDOT Proj ID 0042332
Widening of US 21 Bypass and SC 51

NOW, THEREFORE,

A. If said Bid shall be rejected, or

B. If the principal shall not withdraw said Bid within twenty-four (24) hours after date of opening of the same, and shall within ten (10) days after the prescribed forms are presented to him for signature, enter into a written contract with the OWNER in accordance with the Bid as accepted, and give bonds with good and sufficient surety or sureties, as may be required, for the faithful performance and proper fulfillment of such contract, then the above obligations shall be void and of no effect, otherwise to remain in full force and effect.

C. In the event of the withdrawal of said Bid within the period specified, or the failure to enter into such contract and give such bonds within the time specified, if the principal shall pay the OWNER the difference between the amount specified in said bid and the amount for which the OWNER may procure the required work and supplies, if the latter amount be in excess of the former, then the above obligations shall be void and of no effect, otherwise to remain in full force and effect.

IN WITNESS WHEREOF, the above bounded parties have executed this instrument under their several seals, this ____ day of _____, A.D., *2025,* the name and corporate seal of each corporate party being hereto affixed and these presents duly signed by its undersigned representative, pursuant to authority of its governing body.

AGREEMENT

THIS AGREEMENT, made and entered into this _____ day of _____, *2025* A.D., by and between the York County Government, party of the first part (hereinafter sometimes called the "OWNER"), and _____, party of the second part (hereinafter sometimes called the "CONTRACTOR").

WITNESSETH: That the parties hereto, for the consideration hereinafter set forth, mutually agree as follows:

1. SCOPE OF THE WORK

1.1. The CONTRACTOR shall furnish all labor, materials, equipment, machinery, tools, apparatus, and transportation and perform all of the Work shown on the Drawings and described in the Specifications entitled:

Pennies for Progress Project 3
Widening of US 21 Bypass and SC 51
York County No 11149-004 SCDOT Proj ID 0042332

as prepared by York County Engineering Department acting as, and in the Contract Documents entitled the ENGINEER, and shall do everything required by this Contract and the other Contract Documents.

2. THE CONTRACT SUM

2.1. The OWNER shall pay to the CONTRACTOR for the faithful performance of the Contract, in lawful money of the United States, and subject to addition and deductions as provided in the Contract Documents, a total sum as follows:

Based upon the prices shown in the Bid heretofore submitted to the OWNER by the CONTRACTOR, a copy of said Proposal being a part of these Contract Documents, the aggregate amount of this Contract (obtained from either the lump sum price, the application of unit prices to the quantities shown in the Bid, or the combination of both) being the sum of

_____

($_____).

3. COMMENCEMENT AND COMPLETION OF WORK

3.1. The CONTRACTOR shall commence Work and the Contract Time will commence to run on the date fixed in the Notice to Proceed.

3.2. The CONTRACTOR shall prosecute the Work with faithfulness and diligence and shall be completed and ready for final payment within ***1095 calendar* days** after commencement date fixed in the Notice to Proceed.

3.3 The CONTRACTOR shall prosecute the Work with faithfulness and diligence and shall be completed with the by the **interim completion date of June, 30 2026** before the school opening for the 2026/2027 school year.

4. CONTRACTOR'S ACCEPTANCE OF CONDITIONS

4.1. The CONTRACTOR hereby agrees that, by virtue of submitting a completed Bid including his declarations therein of full satisfaction, knowledge and understanding of the Contract Documents, site conditions (surface and subsurface) and all other conditions affecting the Work, he assumes full responsibility for performance of the Work as required under this Contract. It is expressly agreed that under no circumstances, conditions or situations shall this Contract be more strongly construed against the OWNER than against the CONTRACTOR and his Surety.

4.2. It is understood and agreed that the passing, approval and/or acceptance of any part of the Work or material by the OWNER, ENGINEER, or by any agent or representative, as being in compliance with the terms of this Contract and/or of the Contract Documents, shall not operate as a waiver by the OWNER of strict compliance with the terms of this Contract, and/or the Contract Documents covering said Work; and the OWNER may require the CONTRACTOR and/or his surety to repair, replace, restore and/or make to comply strictly and in all things with this Contract and the Contract Documents any and all of said Work and/or materials which within a period of two years from and after the date of the acceptance of any such Work or material, are found to be defective or to fail in any way to comply with this Contract or with the Contract Documents. This provision shall not apply to materials or equipment normally expected to deteriorate or wear out and become subject to normal repair and replacement before their condition is discovered. Failure on the part of the CONTRACTOR and/or his Surety, immediately after notice to either, to repair or replace any such defective materials and workmanship shall entitle the OWNER, if it sees fit, to replace or repair the same and recover the reasonable cost of such replacement and/or repair from the CONTRACTOR and/or his surety, who shall in any event be jointly and severally liable to the OWNER for all damage, loss and expense caused to the OWNER by reason of the CONTRACTOR's breach of this Contract and/or his failure to comply strictly and in all things with this Contract.

4.3. The CONTRACTOR understands and hereby agrees that the work zone traffic control required to complete the work shall be full included in the Bid and no additional compensation will be made by the OWNER, unless approved and agreed upon by the OWNER sole discretion.

5. LIQUIDATED DAMAGES

5.1. It is mutually agreed that time is of the essence of this Contract and should the CONTRACTOR fail to complete the work within the specified time, or any authorized extension thereof, there shall be deducted from the compensation otherwise to be paid to the CONTRACTOR, and the OWNER will retain the amount of ***Two Thousand, Two Hundred Dollars ($2,200.00)*** per calendar day as fixed, agreed, and liquidated damages for each calendar day elapsing beyond the specified time for **substantial completion** or any authorized extension thereof, which sum shall represent the actual damages which the OWNER will have sustained by failure of the CONTRACTOR to complete the work within the specified time. After substantial completion, if the CONTRACTOR shall neglect, refuse, or fail to complete the remaining Work within the Contract Time or any proper extension thereof granted by OWNER, Contractor shall pay OWNER ***Two Thousand, Two Hundred Dollars ($2,200.00)*** per for each calendar day that expires after the date specified for Final Completion and readiness for final payment until the work is complete and ready for final payment. It being further agreed that said sum is not a penalty, but is the stipulated amount of damages sustained by the OWNER in the event of such default by the CONTRACTOR.

5.2. It is mutually agreed that time is of the essence of this Contract and should the CONTRACTOR fail to complete the work within the specified time, or any authorized extension thereof, there shall be deducted from the compensation otherwise to be paid to the CONTRACTOR, and the OWNER will retain the amount of ***One Thousand, Eight Hundred Dollars ($1,800.00)*** per calendar day as fixed, agreed, and liquidated damages for each calendar day elapsing beyond the specified time for interim completion date for Gold Hill realignment with US 21 or any authorized extension thereof, which sum shall represent the actual damages which the OWNER will have sustained by failure of the CONTRACTOR to complete the work within the specified

time. After substantial completion of the Gold Hill realignment with US 21 , if the CONTRACTOR shall neglect, refuse, or fail to complete the remaining Work within the Contract Time or any proper extension thereof granted by OWNER, Contractor shall pay OWNER ***One Thousand, Eight Hundred Dollars ($1,800.00)*** per for each calendar day that expires after the date specified for interim Completion and readiness for final payment until the work is complete and ready for final payment.

5.3. For the purposes of this Article, the day of final acceptance of the Work shall be considered a day of delay, and the scheduled day of completion of the work shall be considered a day scheduled for production.

6. PARTIAL AND FINAL PAYMENTS

6.1. In accordance with the provisions fully set forth in the General Conditions, and subject to additions and deductions as provided, the OWNER shall pay the CONTRACTOR as follows:

6.1.1. Within 30 days after receipt by the OWNER of the CONTRACTOR's request for partial payment, the OWNER shall make partial payments to the CONTRACTOR, on the basis of the estimate of Work as approved by the ENGINEER, for work performed during the preceding calendar month, less five percent (5%) of the amount of such estimate which is to be retained by the OWNER until all Work has been performed strictly in accordance with this Agreement and until such Work has been accepted by the OWNER.

6.1.2. Upon submission by the CONTRACTOR of evidence satisfactory to the OWNER that all payrolls, material bills and other costs incurred by the CONTRACTOR in connection with the construction of the Work have been paid in full, including all retainage to subcontractors on the project, and also after all guarantees that may be required in the specifications have been furnished and are found acceptable by the OWNER, final payment on account of this Agreement shall be made within sixty (60) days after completion by the CONTRACTOR of all Work covered by this Agreement and acceptance of such Work by the OWNER.

6.1.3. Retainage will be released in full at Final Completion.

7. ADDITIONAL BOND

7.1. It is further mutually agreed between the parties hereto that if, at any time after the execution of this Agreement and the Performance and Payment Bonds hereto attached for its faithful performance, the OWNER shall deem the surety or sureties upon such bonds to be unsatisfactory, or if, for any reason, such bond(s) ceases to be adequate to cover the performance of the Work, the CONTRACTOR shall, at his expense, and within three days after the receipt of notice from the OWNER to do so, furnish an additional bond or bonds, in such form and amount, and with such sureties as shall be satisfactory to the OWNER. In such event, no further payment to the CONTRACTOR shall be deemed due under this Agreement until such new or additional security for the faithful performance of the Work shall be furnished in manner and form satisfactory to the OWNER.

8. CONTRACT DOCUMENTS

8.1. The Contract Documents, as stated in the Instructions to Bidders, including this Project Manual and General Conditions, and the accompanying Contract Drawings, shall form the Contract and are as fully a part of this Contract as if herein repeated.

IN WITNESS WHEREOF the parties hereto have executed this Agreement on the day and date first above written in three (3) counterparts, each of which shall, without proof or accounting for the other counterparts, be deemed an original Contract.*

GENERAL CONDITIONS

1. DEFINITIONS

1.1. Whenever used in any of the Contract Documents, the following meanings shall be given to the terms herein defined:

1.1.1. *Addendum* or *Addenda* - Written or graphic instruments issued prior to the opening of Bids which clarify, correct or change the Bidding Requirements or the Contract Documents.

1.1.2. *Agreement* - The written contract between OWNER and CONTRACTOR covering the Work to be performed; other Contract Documents are attached to the Agreement and made a part thereof as provided therein.

1.1.3. *Application for Payment* - The form accepted by ENGINEER which is to be used by CONTRACTOR in requesting progress or final payments and which is to be accompanied by such supporting documentation as is required by the Contract Documents.

1.1.4. *Bid* - The offer or proposal of the bidder on the prescribed Bid Form setting forth the prices for the Work to be performed.

1.1.5. *Bidder* - One who submits a Bid directly to OWNER, as distinct from sub-bidder, who submits a Bid to a Bidder.

1.1.6. *Bidding Documents* - The Invitation for Bids, Instruction to Bidders, the Bid Form, and the proposed Contract Documents (including all Addenda issued prior to receipt of Bids).

1.1.7. *Bonds* - Performance and Indemnity and Payment Bonds and other instruments of security.

1.1.8. *Change Order* - A document recommended by ENGINEER, which is signed by CONTRACTOR and OWNER and authorizes an addition, deletion or revision in the Work, or an adjustment in the Contract Price or the Contract Times, issued on or after the Effective Date of the Agreement.

1.1.9. *Contract Documents* - Executed Agreement, Addenda (if any), Invitation for Bids, Instructions to Bidders, Signed Copy of Bid, Bid Guarantee, Statement of Bidder's Qualifications, Performance and Indemnity Bond, Payment Bond, Certification of Insurance, General Conditions, Supplemental Conditions (if any), Special Conditions (if any), Technical Specifications, and Drawings (as listed in the Index of Drawings).

1.1.10. *Contract Price* - The moneys payable by OWNER for completion of the Work in accordance with the Contract Documents.

1.1.11. *Contract Times* - The numbers of days or the dates stated in the Agreement: (i) to achieve Substantial Completion, and (ii) to complete the work so that it is ready for final payment as evidenced by ENGINEER's written records.

1.1.12. *CONTRACTOR* - The person, firm, or corporation entering into Contract with the OWNER to construct and install the improvements embraced in this Contract.

1.1.13. *Defective* - An adjective which when modifying the word Work refers to Work that is unsatisfactory, faulty or deficient, in that it does not conform to the Contract Documents, or does not meet the requirements of any inspection, reference standard, test or approval referred to in the Contract Documents, or had been damaged prior to ENGINEER's recommendation or final payment.

1.1.14. *Drawings* - The construction drawings which graphically show the scope, extent, and character of the Work to be furnished and performed by the CONTRACTOR and which have been prepared or approved by ENGINEER and are referred to in the Contract Documents. These Drawings are listed in the Index of Drawings.

1.1.15. *ENGINEER* – The person, firm or corporation serving the OWNER with Engineering services, his successors, or any other person or persons, employed by said OWNER for the purpose of directing or having charge of the work embraced in this Contract.

1.1.16. *Laws and Regulations; Laws or Regulations* – Any and all applicable laws, rules, regulations, ordinances codes and orders of any and all governmental bodies, agencies, authorities and courts having jurisdiction.

1.1.17. *Liens* - Liens, charges, security interests or encumbrances upon project funds, real property or personal property.

1.1.18. *Local Government* - York County, South Carolina, within which the Project Areas are situated.

1.1.19. *Milestone* - A principal event specified in the Contract Documents relating to an intermediate completion date or time prior to Substantial Completion of all the Work.

1.1.20. *Notice of Award* - The written notice by OWNER to the apparent successful Bidder stating that upon compliance by the apparent successful Bidder with the conditions precedent enumerated therein, within the time specified, OWNER will sign and deliver the agreement.

1.1.21. *Notice to Proceed* - A written notice given by OWNER to CONTRACTOR (with a copy to ENGINEER) fixing the date on which the Contract Times will commence to run and on which CONTRACTOR shall start to perform, CONTRACTOR's obligations under the Contract Documents.

1.1.22. O*WNER* - The York County Government, which is authorized to undertake this Contract.

1.1.23. *Partial Utilization* - Use by OWNER of a substantially completed part of the Work for the purpose for which it is intended (or a related purpose) prior to Substantial Completion of all the Work.

1.1.24. *Project* - The total construction of which the Work to be provided under the Contract Documents may be the whole, or a part as indicated elsewhere in the Contract Documents.

1.1.25. *Project Area* - The area within which are the specified limits of the improvements to be constructed in whole or in part under this Contract.

1.1.26. *Project Manual* – The bound documentary information prepared for bidding and constructing the Work. A listing of the contents of the Project Manual, which may be bound in one or more volumes, is contained in the table(s) of contents.

1.1.27. *Resident Project Representative* – The authorized representative of ENGINEER who may be assigned to the Site or any part thereof.

1.1.28. *Samples* - Physical examples of materials, equipment, or workmanship that are representative of some portion of the Work and which establish the standards by which such portion of the Work will be judged.

1.1.29. *Site* – Lands or areas indicated in the Contract Documents as being furnished by OWNER upon which the Work is to be performed, including rights-of-way and easements for access thereto, and such other lands furnished by OWNER which are designated for the use of the CONTRACTOR.

1.1.30. *Shop Drawings* - All drawings, diagrams, illustrations, schedules and other data or information which are specifically prepared or assembled by or for CONTRACTOR and submitted by CONTRACTOR to illustrate some portion of the Work.

1.1.31. S*pecial Conditions* - The part of the Contract Documents that amends or supplements the Technical Specifications.

1.1.32. *Subcontractor* - An individual, firm or corporation having a direct contract with CONTRACTOR or with any other Subcontractor for the performance of a part of the Work at the site.

1.1.33. *Substantial Completion* - The Work (or specified part thereof) has progressed to the point where, in the opinion of ENGINEER as evidenced by ENGINEER's definitive certification of Substantial Completion, it is sufficiently complete, in accordance with the Contract Documents, so that the Work (or specified part) can be utilized for the purposes for which it is intended; or if no such certificate is issued, when the Work is complete and ready for final payment as evidenced by ENGINEER's written recommendation of final payment. The terms "substantially complete" and "substantially completed" as applied to all or part of the Work refer to Substantial Completion thereof.

1.1.34. *Successful Bidder* - The lowest, qualified, responsible and responsive Bidder to whom OWNER (on the basis of OWNER's evaluation as hereinafter provided) makes an award.

1.1.35. *Supplier* – A manufacturer, fabricator, supplier, distributor, material man or vendor having a direct contract with CONTRACTOR or with any Subcontractor to furnish materials or equipment to be incorporated in the Work by CONTRACTOR or any Subcontractor.

1.1.36. *Supplemental Conditions* - The part of the Contract Documents that amends or supplements these General Conditions.

1.1.37. *Technical Specifications* - The part of the Contract Documents that describes, outlines, and stipulates: the quality of materials, equipment and systems to be furnished; the quality of workmanship required; and the methods to be used in carrying out the construction work to be performed under this Contract.

1.1.38. *Underground Facilities* - All pipelines, conduits, ducts, cables, wires, manholes, vaults, tanks, tunnels or other such facilities or attachments, and any encasements containing such facilities which have been installed underground to furnish any of the following services or materials: electricity, gases, steam, liquid petroleum products, telephone or other communications, cable television, sewage and drainage removal, traffic or other control systems, or water.

1.1.39*. Unit Price Work* - Work to be paid for on the basis of unit prices.

1.1.40. *Work* - The entire completed construction or the various separately identifiable parts thereof required to be furnished under the Contract Documents. Work includes and is the result of performing or furnishing and incorporating materials and equipment into the construction, and furnishing, installing and incorporating all materials and equipment into such construction, all as required by the Contract Documents.

1.2 Other technical terms not specifically defined within the Contract Documents shall have the meanings given in AIA Document "Glossary of Construction Industry Terms," current edition. Technical terms not defined as above and used to describe items of the Work, and which so applied have a well-known technical or trade meaning, shall be deemed to have such recognized meaning.

2. CONTRACTOR'S OBLIGATIONS

2.1. All work shall be done in strict accordance with the Contract Documents. Observations, construction reviews, tests, recommendations or approvals by the ENGINEER or persons other than the CONTRACTOR, shall in no way relieve the CONTRACTOR of his obligations to complete all work in accordance with the Contract Documents. All work shall be done under the direct supervision of the CONTRACTOR. The CONTRACTOR shall be responsible for construction means, methods, techniques, and procedures, and for providing a safe place for the performance of the work by the CONTRACTOR, Subcontractors, suppliers, and their employees and for access, use, work, or occupancy by all authorized persons.

3. LANDS BY CONTRACTOR

3.1. OWNER shall furnish the Site. OWNER shall notify CONTRACTOR of any encumbrances or restrictions not of general application, but specifically related to the use of the Site with which the CONTRACTOR must comply in performing work.

3.2. Any land and access thereto not specifically shown to be furnished by the OWNER that may be required for temporary construction facilities or for storage of materials and equipment shall be provided by the CONTRACTOR with no liability to the OWNER. The CONTRACTOR shall confine his apparatus and storage to such additional areas as he may provide at his expense.

3.3. The CONTRACTOR shall not enter upon private property for any purpose without obtaining permission, and he shall be responsible for the preservation of all public property, trees, monuments, structures and improvements, along and adjacent to the street and/or right-of-way, and shall use every precaution necessary to prevent damage or injury thereto. He shall use suitable precautions to prevent damage to pipes, conduits, and other underground structures, and shall protect carefully from disturbance or damage all monuments and property marks until an authorized agent has witnessed or otherwise referenced their location and shall not remove them until directed.

4. SURVEYS BY CONTRACTOR

4.1. Based upon the Construction Documents and any additional information provided by the OWNER, the CONTRACTOR shall develop and make all detailed surveys necessary for construction, including working points, lines and elevations.

5. PUBLIC UTILITIES

5.1. The elevation and location of all public utilities shown on the Drawings were taken from existing public records. It shall be the duty of the CONTRACTOR to make final and exact determination of the location and extent of all utilities and he will be liable for any expense resulting from damage to them.

6. SUPERINTENDENT

6.1. A qualified superintendent, who is acceptable to the OWNER, shall be maintained on the Work and shall give efficient supervision to the Work until its completion. The superintendent shall have full authority to act in behalf of the CONTRACTOR, and all instruction given to the superintendent shall be considered as given to the CONTRACTOR. It shall be the responsibility of this CONTRACTOR's superintendent to coordinate the Work of all the Subcontractors. The superintendent shall be present on the site at all times required to perform adequate supervision and coordination.

7. SUBCONTRACTORS

7.1. At the time set forth in the Contract Documents or when requested by the OWNER, the CONTRACTOR shall submit in writing for review of the OWNER the names of the Subcontractors proposed for the work. Subcontractors may not be changed except at the request or with the approval of the OWNER. The CONTRACTOR is responsible to the OWNER for the acts and deficiencies of his Subcontractors, and of their direct and indirect employees, to the same extent as he is responsible for the acts and deficiencies of his employees. The Contract Documents shall not be construed as creating any contractual relation between any Subcontractor and the OWNER. The CONTRACTOR shall bind every Subcontractor by the terms of the Contract Documents.

8. ASSIGNMENTS

8.1. The CONTRACTOR shall not assign the whole or any part of this Contract or any moneys due or to become due hereunder without written consent of the OWNER. In case the CONTRACTOR assigns all or any part of any moneys due or to become due under this Contract, the instrument of assignment shall contain a clause substantially to the effect that it is agreed that the right of the assignee in and to any moneys due or to become due to the CONTRACTOR shall be subject to prior claims of all persons, firms, and corporations for services rendered or materials supplied for the performance of the work called for in this Contract.

9. MUTUAL RESPONSIBILITY OF CONTRACTORS

9.1. If through acts of neglect on the part of the CONTRACTOR, any other CONTRACTOR or any Subcontractor shall suffer loss or damage on the work, the CONTRACTOR agrees to settle with such other CONTRACTOR or Subcontractor by agreement or arbitration if such other CONTRACTOR or Subcontractor will so settle. If such other CONTRACTOR or Subcontractor shall assert any claim against the OWNER on account of any damage alleged to have been sustained, the OWNER shall notify the CONTRACTOR, who shall indemnify and save harmless the OWNER against any such claim.

10. ORAL AGREEMENTS

10.1. No oral order, objection, claim or notice by any party to the others shall affect or modify any of the terms or obligations contained in any of the Contract Documents, and none of the provisions of the Contract Documents shall be held to be waived or modified by reason of any act whatsoever, other than by a definitely agreed waiver or modification thereof in writing, and no evidence shall be introduced in any proceeding of any other waiver or modification.

11. MATERIALS, SERVICE AND FACILITIES

11.1. It is understood that except as otherwise specifically stated in the Contract Documents, the CONTRACTOR shall provide and pay for all materials, labor, tools, equipment, water, gas, light, power, transportation, superintendence, taxes, insurance, temporary construction of every nature, and all other services and facilities of every nature whatsoever necessary to execute, complete, and deliver the work within the specified time.

11.2. Any work necessary to be performed after regular working hours, on Sundays or Legal Holidays, shall be performed without additional expense to the OWNER.

12. MATERIALS AND EQUIPMENT

The materials and equipment installed in the work shall meet the requirements of the Contract Documents and no materials or equipment shall be ordered until reviewed by the ENGINEER. The CONTRACTOR shall furnish all materials and equipment not otherwise specifically indicated or provided by the OWNER.

The CONTRACTOR shall guarantee all materials and equipment he provides in accordance with Section 16 of these GENERAL CONDITIONS.

12.1. Substitutions: In order to establish standards of Quality, the ENGINEER has, in the detailed Specifications, referred to certain products by name and catalog number without consideration of possible substitute or “or equal” items. This procedure is not to be construed as eliminating from competition other products of equal or better quality by other manufacturers where fully suitable in design.

12.1.1. Whenever it is indicated in the Drawings or specified in the specifications that a substitute or “or-equal” item of material or equipment may be furnished or used by the CONTRACTOR, application for such acceptance will not be considered by the ENGINEER until after the Effective Date of the agreement. The CONTRACTOR shall furnish the complete list of proposed desired substitutions, together with such engineering and catalog data as the ENGINEER may require. All proposals for substitutions shall be submitted in writing by the General Contractor and not by individual trades or material suppliers. The ENGINEER will review proposed substitutions and make his recommendations in writing within reasonable time.

12.1.2. The CONTRACTOR shall abide by the ENGINEER's recommendation when proposed substitute materials or items of equipment are not recommended for installation and shall furnish the specified material or item of equipment in such case.

12.2. Space Requirements: It shall be the responsibility of the CONTRACTOR to insure that materials and equipment to be furnished fit the space available. He shall make necessary field measurements to ascertain space requirements, including those for connections, and shall order such sizes and shapes of equipment that the final installation shall suit the true intent and meaning of the Contract Documents.

12.3. Arrangement: Where equipment requiring different arrangement of connections from those shown is approved, it shall be the responsibility of the CONTRACTOR to install the equipment to operate properly, and in harmony with the intent of the work required by such arrangement.

12.4. Unacceptable Materials and Equipment: Materials and equipment which do not conform to the requirements of the Contract Documents, or are not equal to samples reviewed by the ENGINEER, or are in any way unsatisfactory or unsuited to the purpose for which they are intended, shall not be furnished nor installed.

12.5. Storage: Materials and equipment shall be so stored as to insure the preservation of their quality and fitness for the work. When considered necessary, they shall be placed on wooden platforms or other hard, clean surfaces, and not on the ground and/or they shall be placed under cover. Stored materials and equipment shall be located so as to facilitate prompt inspection. Private property shall not be used for storage purposes without the written permission of the property owner or leasee. Materials, equipment, construction machinery, fuel, and oils shall not be stored or parked within the drip-line of any trees in or adjacent to the project site or additional off-site easements and right-of-ways.

12.6. Manufacturer's Directions: Manufactured articles, materials and equipment shall be applied, installed, connected, erected, used, cleaned, and conditioned as directed by the manufacturer.

13. INSPECTION AND TESTING OF MATERIALS

13.1. Unless otherwise specifically provided for in the specifications, the inspection and testing of material and finished articles to be incorporated in the work at the site shall be made by bureaus, laboratories, or agencies approved by the OWNER. The cost of such inspection and testing shall be paid by the CONTRACTOR. The CONTRACTOR shall furnish evidence satisfactory to the OWNER that the material and finished articles have passed the required tests prior to the incorporation of such materials

and finished articles in the work. The CONTRACTOR shall promptly segregate and remove rejected material and finished articles from the site of the work.

14. SAMPLES

14.1. All samples called for in the Specifications or required by the ENGINEER shall be furnished by the CONTRACTOR and shall be submitted to the ENGINEER for his review. Samples shall be furnished so as not to delay fabrication, allowing the ENGINEER reasonable time for the consideration of the samples submitted.

14.1.1. Samples for Tests: CONTRACTOR shall furnish such samples of material as may be required for examination and test. All samples of materials for tests shall be taken according to standard methods or as provided in the Contract Documents.

14.1.2. CONTRACTOR's Guaranty: All samples shall be submitted by the CONTRACTOR with a covering letter indicating that such samples are recommended by the CONTRACTOR for the service intended and that the CONTRACTOR's Guaranty will fully apply.

14.1.3. All materials, equipment and workmanship shall be in accordance with samples guaranteed by the CONTRACTOR and reviewed by the ENGINEER.

15. SHOP DRAWINGS

15.1. The CONTRACTOR shall provide shop drawings, setting schedules and such other drawings as may be necessary for the prosecution of the work in the shop and in the field as required by the Drawings, Specifications or the ENGINEER's instructions. Deviations from the Drawings and Specifications shall be called to the attention of the ENGINEER at the time of the first submission of shop drawings and other drawings for consideration. The ENGINEER's review of any drawings shall not release the CONTRACTOR from responsibility for such deviations. Shop drawings shall be submitted according to a schedule prepared jointly by the CONTRACTOR and the ENGINEER.

15.1.1. CONTRACTOR's Certification: When submitted for the ENGINEER's review, shop drawings shall bear the CONTRACTOR's certification that he has reviewed, checked and approved the shop drawings, that they are in harmony with the requirements of the Project and with the provisions of the Contract Documents, and that he has verified all field measurements and construction criteria, materials, catalog numbers and similar data. CONTRACTOR shall also certify that the work represented by the shop drawings is recommended by the CONTRACTOR and the CONTRACTOR's Guaranty will fully apply.

16. GUARANTY

16.1. The CONTRACTOR shall guarantee all materials and equipment furnished and work performed for a period of one years from the date of final payment of the work.

16.1.1. The Performance and Indemnity Bond shall remain in full force and effect during the guaranty period.

16.1.2. Correction of faulty work after final payment shall be as provided in Paragraph 41.

17. INSURANCE

17.1. The CONTRACTOR shall not commence any work until he obtains, at his own expense, all required insurance. Such insurance must have the approval of the OWNER as to the limit, form, and amount. The CONTRACTOR will not permit any Subcontractor to commence work on this project until such Subcontractor has complied with the same insurance requirements.

Types: The types of insurance the CONTRACTOR is required to obtain
and maintain for the full period of the Contract will be: Workmen's Compensation Insurance, Automobile and Comprehensive General Liability Insurance as detailed in the following portions of this specification.

17.1.2. Evidence: As evidence of specified insurance coverage, the OWNER may, in lieu of actual policies, accept certificates issued by the insurance carrier showing such policies in force for the specified period. Each policy or certificate will bear an endorsement or statement waiving right of cancellation or reduction in coverage within ten days' notice in writing to be delivered by registered mail to the OWNER. Should any policy be cancelled before final payment by the OWNER to the CONTRACTOR and the CONTRACTOR fails immediately to procure other insurance as specified, the OWNER reserves the right to procure such insurance and to deduct the cost thereof from any sum due the CONTRACTOR under this Contract.

17.1.3. Adequacy of Performance: Any insurance bearing on adequacy of performance shall be maintained after completion of the project for the full guaranty period. Should such insurance be cancelled before the end of the guaranty period and the CONTRACTOR fails immediately to procure other insurance as specified, the OWNER reserves the right to procure such insurance and to charge the cost thereof to the CONTRACTOR.

17.1.4. Payment of Damages: Nothing contained in these insurance requirements is to be construed as limiting the extent of the CONTRACTOR's responsibility for payment of damages resulting from his operations under this Contract.

18. WORKMEN'S COMPENSATION INSURANCE

18.1. Before the Agreement between the OWNER and the CONTRACTOR is entered into, the CONTRACTOR shall submit written evidence that he and all Subcontractors have obtained, for the period of the Contract, full Workman's Compensation Insurance coverage for all persons whom they employ or may employ in carrying out the work under this Contract. This insurance shall be in strict accordance with the requirements and statutory limits of the most current and applicable South Carolina Workman's Compensation Insurance Laws.

19. COMPREHENSIVE GENERAL LIABILITY AND AUTOMOBILE INSURANCE

19.1. Before commencement of the work, the CONTRACTOR shall submit written evidence that he and all his Subcontractors have obtained for the period of the Contract, full Comprehensive General Liability Insurance and automobile coverage. This coverage shall provide for both bodily injury and property damage.

19.1.1. Comprehensive General Liability Insurance shall include coverage for bodily injury, sickness or disease, death, or property damage arising directly or indirectly out of or in connection with the performance of work under this Contract, and shall provide for a combined single limit of not less than one million ($1,000,000) dollars for all damages arising out of bodily injury, sickness or disease, death, or property damage for each occurrence.

19.1.2. Automobile insurance shall include coverage for bodily injury and property damage arising directly or indirectly out of or in connection with the performance of work under this Contract, and shall provide for a combined single limit of not less than one million ($1,000,000) dollars for all damages arising out of bodily injury or property damage for each occurrence.

19.1.3. Indemnity: Included in such insurance will be contractual coverage sufficiently broad to insure the provisions of Paragraph 20.

20. INDEMNITY

20.1. The CONTRACTOR shall hold harmless, indemnify and defend the OWNER, it's successors and assigns, the ENGINEER, their consultants, and each of their officers and employees and agents, from any and all liability claims, losses or damage arising or alleged to arise from the performance of the work described herein, but not including the sole negligence of the OWNER or the ENGINEER.

21. PATENTS AND ROYALTIES

21.1. If any design, device, material or process covered by letters, patent or copyright is used by the CONTRACTOR, he shall provide for such use by legal agreement with the OWNER of the patent or a duly authorized licensee of such OWNER, and shall save harmless the OWNER, and the ENGINEER, from any and all loss or expense on account thereof, including its use by the OWNER.

22. PERMITS

22.1. All permits and licenses necessary for the prosecution of the work shall be secured and paid for by the CONTRACTOR. This shall include all Business Licenses required by the Local Government.

23. LAWS TO BE OBSERVED

23.1. The CONTRACTOR shall give all notices and comply with all Federal, State and local laws, ordinances and regulations in any manner affecting the conduct of the work, and all such orders and decrees as exist, or may be enacted by bodies or tribunals having any jurisdiction or authority over the work, and shall indemnify and save harmless the OWNER its successors and assigns, the ENGINEER, their consultants, and each of their officers and employees and agents against any claim or liability arising from, or based on, the violation of any such law, ordinance, regulation, order or decree, whether by himself or his employees.

24. WARNING SIGNS AND BARRICADES

24.1. The CONTRACTOR shall provide adequate signs, barricades, red lights and watchmen and take all necessary precautions for the protection of the work and the safety of the public. All barricades and obstructions shall be kept burning from sunset to sunrise. Barricades shall be of substantial construction and shall be placed and illuminated at night as to show in advance where construction, barricades, or detours exist.

25. PUBLIC CONVENIENCE

25.1. The CONTRACTOR shall at all times so conduct his work as to insure the least possible obstruction to traffic and inconvenience to the general public and the residents in the vicinity of the work, and to insure the protection of persons and property. No road or street shall be closed to the public except with permission of the proper authorities. Fire hydrants on or adjacent to the work shall be kept accessible to fire-fighting equipment at all times. Temporary provisions shall be made by the CONTRACTOR to insure the use of sidewalks and the proper functioning of all gutters, sewer inlets, drainage ditches, and irrigation ditches, which shall not be obstructed.

26. SAFETY

26.1. The CONTRACTOR shall be solely and completely responsible for the conditions of the job site, including safety of all persons and property affected directly or indirectly by his operation during the performance of the work. This requirement will not be limited to normal working hours but will only apply continuously 24 hours per day until written acceptance of the work by the OWNER and shall not be limited to normal working hours.

26.2. The ENGINEER's construction reviews of the CONTRACTOR's performance is not intended to include review of the adequacy of the CONTRACTOR's safety measures in, on, or near the construction site.

27. NOTICE TO PROCEED

27.1. Following the execution of the Contract by the OWNER and the CONTRACTOR, written Notice to Proceed with the work shall be given by the OWNER to the CONTRACTOR. The CONTRACTOR shall begin and shall prosecute the work regularly and uninterruptedly thereafter (except as provided for herein) with such force as to secure the completion of the work within the Contract Time.

28. TIME FOR COMPLETION AND LIQUIDATED DAMAGES

28.1. It is hereby understood and mutually agreed, by and between the CONTRACTOR and the OWNER, that the date of beginning and the time for completion as specified in the Contract of the work to be done hereunder are ESSENTIAL CONDITIONS of this Contract; and it is further mutually understood and agreed that the work embraced in this Contract shall be commenced on a date to be specified in the Notice to Proceed.

28.2. The CONTRACTOR agrees that said work shall proceed regularly, diligently, and uninterruptedly at such rate of progress as will insure full completion thereof within the time specified. It is expressly understood and agreed, by and between the CONTRACTOR and the OWNER, that the time for the completion of the work described herein is a reasonable time for the completion of the same, taking into consideration the average climatic range and usual industrial conditions prevailing in this locality.

28.3. If said CONTRACTOR shall neglect, fail, or refuse to complete the work within the time herein specified, or any proper extension thereof granted by the OWNER, then the CONTRACTOR does hereby agree, as a part consideration for the awarding of this Contract, to pay to the OWNER the amount specified in the Contract, not as a penalty but as liquidated damages for such breach of contract as hereinafter set forth, for each and every calendar day that the CONTRACTOR shall be in default after the time stipulated in the Contract for completing the work.

28.4. The said amount is fixed and agreed upon by and between the CONTRACTOR and the OWNER because of the impracticability and extreme difficulty of fixing and ascertaining the actual damages the OWNER would in such event sustain, and said amount is agreed to be the amount of damages which the OWNER would sustain and said amount shall be retained from time to time by the OWNER from current periodical estimates.

28.5. It is further agreed that time is of the essence of each and every portion of this Contract and of the Specifications wherein a definite and certain length of time is fixed for the performance of any act whatsoever; and where under the Contract an additional time is allowed for the completion of any work, the new time limit fixed by such extension shall be of the essence of this Contract. PROVIDED, that the CONTRACTOR shall not be charged with liquidated damages or any excess cost when the delay in completion of the work is due to the following:

28.5.1. Any preference, priority or allocation order duly issued by the Federal or State Government.

28.5.2. Unforeseeable cause beyond the control and without the fault or negligence of the CONTRACTOR, including, but not restricted to, acts of God, or of the public enemy, acts of the OWNER, acts of another CONTRACTOR in the performance of a contract with the OWNER, fires, flood, epidemics, quarantine restrictions, strikes, freight embargoes and unusually severe weather; and

28.5.3. Any delays of Subcontractors or suppliers occasioned by any of the causes specified in subsection 28.5.1. and 28.5.2. of this article:

PROVIDED, FURTHER, that the CONTRACTOR shall, within 10 days from the beginning of such delay, unless the OWNER shall grant a further period of time prior to the date of final settlement of the contract, notify the OWNER, in writing, of the causes of the delay, who shall ascertain the facts and extent of the delay and notify the CONTRACTOR within a reasonable time of its decision in the matter, and grant such extension of time as the OWNER shall deem equitable and just.

29. CONSTRUCTION SCHEDULE AND PERIODIC ESTIMATES

29.1. Immediately after execution and delivery of the contract, and before the first partial payment is made, the CONTRACTOR shall deliver to the OWNER an estimated construction progress schedule in a form satisfactory to the OWNER, showing the proposed dates of commencement and completion of each of the various subdivisions of work required under the Contract Documents.

30. EXTENSION OF CONTRACT TIME

30.1. A delay beyond the CONTRACTOR's control occasioned by an Act of God, by act or omission on the part of the OWNER or by strikes, lockouts, fire, etc., may entitle the CONTRACTOR to any extension of time in which to complete the work as agreed by the OWNER, provided, however, that the CONTRACTOR shall immediately give written notice to the OWNER of the cause of such delay.

30.2. Act of God shall mean an earthquake, flood, cyclone, or other cataclysmic phenomenon. Storms of normal intensity for the locality shall not be construed as an Act of God and no reparation shall be made to the CONTRACTOR for damages to the work resulting there from.

31. EXTRA WORK

31.1. New and unforeseen items of work found to be necessary, and which cannot be covered by any item or combination of items for which there is a Contract price, shall be classed as Extra Work. It shall be the responsibility of the CONTRACTOR to identify necessary work items classed as Extra Work and for which no previous contract price has been arranged and advise the ENGINEER and the OWNER of the need for the aforesaid necessary Extra Work. The CONTRACTOR shall do such Extra Work and furnish such materials as may be required for the proper completion or construction of the whole work contemplated, upon written order from the OWNER as approved by the ENGINEER. In the absence of such written order, no claim for Extra Work shall be considered.

31.2. Extra Work shall be performed in accordance with these Contract Documents where applicable and work not covered by such shall be done in accordance with the best construction practice and in a workmanlike manner.

31.3. Extra Work required in an emergency to protect life and property shall be performed by the CONTRACTOR as required.

32. CLEANING UP

32.1. The CONTRACTOR shall at all times, keep the premises clean and shall remove from the OWNER's property, and from all public and private property, temporary structures, rubbish, waste materials resulting from his operation or caused by his employees, and all surplus materials, leaving the site smooth, clean and true to line and grade and in the same condition as existed prior to the work performed by the CONTRACTOR or his Subcontractors and as approved by the OWNER. Failure to maintain a clean project site or to complete clean-up of the project site at the completion of the work shall be cause for the OWNER to perform the necessary clean-up and the costs thereof shall be charged to the CONTRACTOR.

33. REQUEST FOR PAYMENT

33.1. The CONTRACTOR may submit to the OWNER periodically, but not more than once each month, a Request for Payment for work done and materials delivered to and stored on the site. The CONTRACTOR shall furnish the OWNER all reasonable information required for obtaining the necessary data relative to the progress and execution of the work. Payment for materials stored on the site will be conditioned upon evidence submitted to establish the OWNER's title to such materials. Each Request for Payment shall be computed on the basis of work completed on all items listed in the Detailed Breakdown of Contract (or on unit prices, as the case may be), less retainage as stated in Special Provisions until final completion and acceptance of the work and less previous payments.

34. ENGINEER'S ACTION ON REQUEST FOR PAYMENT

34.1. All CONTRACTOR's Requests for Payment shall be referred to the ENGINEER for his review and, within a reasonable period, the ENGINEER shall:

34.1.1. Recommend payment by the OWNER of the Request for Payment as submitted.

34.1.2. Recommend payment by the OWNER of such other amount as the ENGINEER shall consider as due the CONTRACTOR, informing the OWNER and the CONTRACTOR in writing of his reasons for recommending the amended amount.

34.1.3. Recommend to the OWNER that payment of the Request for Payment be withheld, informing the CONTRACTOR and the OWNER in writing of his reasons, for so recommending.

35. OWNER'S ACTION ON REQUEST FOR PAYMENT

35.1. Within thirty days after receipt of a Request for Payment from the CONTRACTOR, the OWNER shall:

35.1.1. Pay the Request for Payment as recommended by the ENGINEER.

35.1.2. Pay such other amount, in accordance with Paragraph 36, as he shall decide is due the CONTRACTOR, informing the CONTRACTOR and the ENGINEER in writing of this reasons for paying the amended amount.

35.1.3. Withhold payment in accordance with Paragraph 36, informing the CONTRACTOR and the ENGINEER of his reasons for withholding payment.

36. OWNER'S RIGHT TO WITHHOLD PAYMENT OF A REQUEST FOR PAYMENT

36.1. The OWNER may withhold payment, in whole or in part, of a Request for Payment to the extent necessary to protect himself from loss on account of any of the following:

36.1.1. Defective work.

36.1.2. Evidence indicating the probable filing of claims by other parties against the CONTRACTOR that may adversely affect the OWNER.

36.1.3. Failure of the CONTRACTOR to make payments due to Subcontractors, material suppliers, or employees.

36.1.4. Damage to another CONTRACTOR.

37. PAYMENT FOR EXTRA WORK

37.1. Written notice of claims for payment for Extra Work shall be given by the CONTRACTOR within ten days after receipt of instructions from the OWNER to proceed with the Extra Work and also before any work is commenced, except in emergency endangering life or property. No claim shall be valid unless so made. In all cases, the CONTRACTOR's itemized estimate sheets showing all labor and material shall be submitted to the OWNER. The OWNER's order for Extra Work shall specify any extension of the Contract Time and one of the following methods of payment:

37.1.1. Unit prices or combination of unit prices which formed the basis of the original Contract.

37.1.2. A lump sum based on the CONTRACTOR's estimate and accepted by the OWNER.

37.1.3. Actual cost plus 15 percent for overhead and profit. Actual costs are defined as follows:

37.1.3.1. Labor costs, including time of foreman while engaged directly upon extra work.

37.1.3.2. Labor insurance and taxes.

37.1.3.3. Materials and supplies actually used on the work.

37.1.3.4. Associated General Contractors of America standard rental rates on each piece of equipment having a value in excess of $50.00. Equipment and tools of lesser value are considered "small tools" and, as such, are considered to be part of overhead.

38. ACCEPTANCE AND FINAL PAYMENT

38.1. When the CONTRACTOR has completed the work in accordance with the terms of the Contract Documents, he shall certify completion of the work to the OWNER and submit a final Request for Payment, which shall be the Contract Amount plus all approved additions, less all approved deductions and less previous payments made. The CONTRACTOR shall furnish evidence that he has fully paid all debts for labor, materials, and equipment incurred in connection with the work, and upon acceptance by the OWNER, the OWNER will release the CONTRACTOR except as to the conditions of the Performance and Indemnity Bond and the Labor and Material Payment Bond, any legal rights of the OWNER, required guaranties, and Correction of Faulty Work after Final Payment, and will pay the CONTRACTOR's final Request of Payment. The CONTRACTOR shall allow sufficient time between the time of completion of the work and approval of the final Request for Payment for the ENGINEER to assemble and check the necessary data.

38.1.1. Release of Liens: The CONTRACTOR shall deliver to the OWNER a complete release of all liens arising out of this Contract before the retained percentage or before the final Request for Payment is paid. If any liens remains unsatisfied after all payments are made, the CONTRACTOR shall refund to the OWNER such amounts as the OWNER may have been compelled to pay in discharging such liens including all costs and a reasonable attorney's fees.

39. OWNER'S RIGHT TO TERMINATE AGREEMENT

39.1. The OWNER shall have the right to terminate his agreement with the CONTRACTOR after giving ten days' written notice of termination to the CONTRACTOR in the event of any default by the CONTRACTOR.

39.1.1 Default by CONTRACTOR: It shall be considered a default by the CONTRACTOR whenever he shall:

39.1.1.1. Declare bankruptcy, become insolvent, or assign his assets for the benefit of his creditors.

39.1.1.2. Disregard or violate provisions of the Contract Documents or fail to prosecute the work according to the agreed Schedule of Completion, including extensions thereof.

39.1.1.3. Fail to provide a qualified superintendent, competent workmen or Subcontractors, or proper materials, or fail to make prompt payment thereof.

39.1.2. Completion by the OWNER: In the event of termination of the Agreement by the OWNER because of default by the CONTRACTOR, the OWNER may take possession of the work and of all materials and equipment thereon and may finish the work by whatever method and means he may select.

40. TERMINATION OF CONTRACTOR'S RESPONSIBILITY

40.1. The Contract will be considered complete when all work has been finished and the project accepted in writing by the OWNER. The CONTRACTOR's responsibility shall then cease, except as set forth in his Performance and Indemnity Bond, as provided in Paragraph 16, Guaranty, and as provided in Paragraph 41, Correction of Faulty Work After Final Payment.

41 CORRECTION OF FAULTY WORK AFTER FINAL PAYMENT

41.1. The making of the final payment by the OWNER to the CONTRACTOR shall not relieve the CONTRACTOR of responsibility for faulty materials or workmanship. The CONTRACTOR shall promptly replace any such defects, as determined by the ENGINEER, discovered within two years from the date of final payment of the work.

42. INSPECTION

42.1. The authorized representatives of the ENGINEER and OWNER shall be permitted to inspect all materials, workmanship, and other relevant project records and data. Materials and workmanship will be subject to the approval of the OWNER and/or his representative.

43. CORRECTION OF WORK

43.1. All work, all materials, whether incorporated in the work or not, all processes of manufacture, and all methods of construction shall be, at all times and places, subject to the inspection of the ENGINEER who shall be the final judge of the quality and suitability of the work, materials, process of manufacturer, and methods of construction for the purposes for which they are used. Should they fail to meet his approval, they shall be forthwith reconstructed, made good, replaced and/or corrected, as the case may be, by the CONTRACTOR at his own expense. Rejected material shall immediately be removed from the site. If, in the opinion of the ENGINEER, it is undesirable to replace any defective or damaged materials or to reconstruct or correct any portion of the work injured or not performed in accordance with the Contract hereunder shall be reduced by such amount as in the judgment of the ENGINEER shall be equitable.

44. SUBSURFACE CONDITIONS FOUND DIFFERENT

44.1. Should the CONTRACTOR encounter subsurface and/or latent conditions at the site materially differing from those shown on the Plans or indicated in the Specifications, he shall immediately give notice to the ENGINEER of such conditions before they are disturbed. The ENGINEER will thereupon promptly investigate the conditions, and if he finds and so determines that they materially differ from those shown on the Plans or indicated in the Specifications, he will at once make such changes in the Plans

and/or Specifications, as he may find necessary. Any increase or decrease of cost resulting from such changes are to be adjusted in the manner provided in Paragraph 37 of the General Conditions.

45. CONTRACT SECURITY

45.1. The CONTRACTOR shall furnish a Performance Indemnity Bond and Payment Bond (forms attached) in an amount at least equal to 100% of the contract prices as security for the faithful performance of this Contract, as the security for the payment of all persons performing labor on the project under this Contract, and furnishing materials in connection with this Contract. The Performance and Indemnity Bond and the Payment Bond may be in one or in separate instruments in accordance with local law. Before final acceptance, each bond must be approved by the OWNER.

46. DISPUTE RESOLUTION

46.1 OWNER and CONTRACTOR agree to negotiate all disputes between them in good faith prior to exercising their rights under law.

46.2 Any claim, dispute or other matter in question arising from or related to this Agreement or the performance or breach thereof, which cannot be resolved through direct discussions between parties shall be subject to mediation as a condition precedent to the institution of legal or equitable proceedings by either party, and only after both parties have completed the mediation process.

46.3 Through mediation, CONTRACTOR and OWNER shall endeavor to resolve claims, disputes, or other matters in question between them by mediation in an informal process in which a third-party mediator facilitates discussion between the parties. The parties may designate a mediator mutually agreeable to both CONTRACTOR and OWNER to conduct the mediation. If the parties are unable to agree upon a mediator, mediation shall be conducted in accordance with the mediation provision of the South Carolina Circuit Court Alternative Dispute Resolution Rules. The mediation shall be conducted in York County, South Carolina. A request for mediation shall be filed in writing with the other party to this Agreement, and legal or equitable proceedings shall be stayed pending mediation for a period of sixty (60) days from the date of the request for mediation is filed, unless stayed for a longer period of time by agreement of the parties or court order. The cost of a third-party mediator will be shared equally by the parties.

46.4 If the parties reach an agreement during the mediation process, they shall reduce the agreement to writing and sign it with their attorneys, if any. Agreements reached in mediation shall be enforceable as settlement agreements in any court having jurisdiction thereof.

46.5 In any action or proceedings to enforce or interpret any provision of this Agreement, or where any provision herein is validity asserted as a defense, each Party shall bear its own attorney fees, costs, and expenses.

47. CONTRACTOR'S/SUBCONTRACTOR'S PERSONNEL

47.1 Contractor warrants that all Contractor/Subcontractor personnel engaged in the performance of Work under this Contract shall possess sufficient experience and/education to perform the services requested by the County. County expressly retains the right to have any of the Contractor/Subcontractor personnel removed from performing services under this Contract. Contractor shall effectuate the removal of the specified Contractor/Subcontractor personnel from providing any services to the County under this Contract within one business day of notification by County. County shall submit the request in writing to the Contractor's Project Manager. The County is not required to provide any reason, rationale or additional factual information if it elects to request any specific Contractor personnel be removed from performing services under this Contract.

END OF SECTION

SPECIAL CONDITIONS

1. All work performed by the Contractor must be in accordance with the South Carolina Department of Transportation (SCDOT) 2007 Standard Specification for Highway Construction and SCDOT Traffic Signals Material Specifications (latest edition), unless directed otherwise in the plans or by the Engineer. A full version of the 2007 Edition SCDOT Standard Specifications For Highway Construction may be viewed or downloaded on SCDOT's website at www.scdot.org.

2. All work performed by the Contractor shall be constructed using the SCDOT'S Current Standard Drawings with all updates effective at the time of the letting, unless directed otherwise in the plans or by the Engineer. The Standard Drawings are available for download on SCDOT's website www.scdot.org. All drawings that are updated are labeled with their effective letting date in red.

3. There are no known underground storage tanks (UST) within the (present/new) right-of-way. Phase I and Phase II Environmental Site Assessments were conducted for the project and are attached in the Appendix. Seven (7) LUST sites are located adjacent to the subject project. It is the Contractor's responsibility to investigate the project site prior to bidding to determine all structures and obstructions requiring removal. In accordance with Section 202 of SCDOT Specifications, payment for the removal and satisfactory disposal of all underground storage tanks shall be included in the lump sum bid item of 2021000 "Removal of Structures and Obstructions" and includes all materials, labor, equipment, tools, supplies, transportation, removal & disposal of soil and all other incidentals necessary to complete the work. For bidding purposes, it is to be assumed that there is one (1) UST in the Lum Sum pay item 2021000. The Contractor shall be paid based on the Lum Sum cost per UST found and removed, or the bid unit price submitted by the contractor multiplied the number of UST actual found and removed within the construction limits. The contractor shall notify the RCE and County of any discovered UST prior to removal and obtain written approval.

   All work shall be performed in accordance with the Department of Health and Environmental Control (DHEC) requirements by contracting personnel certified by DHEC. The Contractor will be required to obtain all permits and provide the required closure reports for all tank removals.

4. The Contractor shall be liable and responsible for payment of fines assessed by any regulatory agency due to non-compliance with applicable permit requirements and/or regulations by the Contractor. In the event that Owner is fined due to non-compliance with permit requirements, the Owner will charge the Contractor the cost of the fine by deducting an equal amount from the next progress pay estimate.

5. In the Bid Proposal Form and Schedule, Division I-Section 3, contract items given a unique seven (7) digit Item Number shall be constructed in accordance with SCDOT Standard Specifications. The first three (3) digits correspond to sections of the SCDOT Standard Specifications. The remaining four (4) digits are for individual identification of each contract item. Contract items that are identified with Item Numbers beginning with W, S, F, and SP shall be constructed in accordance with specifications contained within this document.

6. Construction conditions requiring minor vertical adjustments (0-2 ft.) to existing water line valve boxes, sanitary sewer manholes, and other minor appurtenances shall be the responsibility of the Contractor. The costs for the adjustments shall be the Contractor's responsibility and shall be included in Bid Item, Mobilization. Other utilities requiring relocation or adjustment for construction activities will be the responsibility of the utility owner.

7. Reconstruction of driveways and other special provisions on properties, included in the right-of-way acquisition, shall be coordinated with the Engineer. Contractor shall notify Engineer prior to construction of driveways.

8. The Owner will obtain the South Carolina Department of Health and Environmental Control (DHEC) Notice of Intent (NOI) for the project. The Contractor's signature is required on several documents necessary for obtaining the permit including, but not limited to, the NOI application, weekly inspection reports and Co-Permittee Agreements. The Contractor shall cooperate with the Owner in providing the required signatures. The Contractor shall be responsible for posting at the project site and keeping on file, permit approvals and other notices as required by permits for the project. The NOI also requires that on-site preconstruction conferences be held for the Prime Contractor and all subcontractors. The Contractor shall participate in these meetings as required by the NOI.

9. Testing shall be conducted by the Owner/Engineer in accordance with the procedures defined in the SCDOT Standard Specifications, and applicable Supplemental Specifications.

10. The Contractor shall provide all record drawing information to the Engineer prior to final approval.

11. Commercial advertising signs (realtor signs) within the construction limits should be removed and left on adjacent property - Do not reinstall. No direct payment will be made for removing these signs as the work is considered incidental to the item of clearing and grubbing.

12. Mailboxes are to be relocated at the direction of the Engineer. No direct payment will be made for the relocation of mailboxes.

13. The removal or relocation of billboards is not the Contractor's responsibility.

14. Non-conforming signs that are not to be relocated shall be removed and placed on the property beyond the construction limits.

15. In the interest of closing out this project in a prompt and timely manner, the Contractor shall complete item 1090200 (as-built construction plans) within 45 days of the substantial completion or final acceptance of the project. The final pay request as required in Section 4.37 of the General Conditions shall be submitted within 120 calendar days of the Owner's final acceptance of the project. The Owner shall impose a $200 per calendar day penalty for failure on the Contractor's part to complete and submit final closeout documents including the final pay request within the required 120 days. This late penalty shall be deducted from the project retainage for each calendar day beyond the allowed 120 days.

16. Temporary lane closure shall be conducted in accordance with SCDOT standard details and as directed by the Engineer. The Contractor shall submit a lane closure plan to the Engineer seven (7) calendar days prior to a lane closure. The Contractor shall notify all agencies responsible for emergency services of the lane closure schedule seven (7) calendar days prior to closure.

17. Partial Payments – The following retainage will be withheld pending final completion and final payment. A percentage based on the amount of the contract completed, shall be retained on each estimate until payment of the final estimate. The retainage shall be 5 percent until the project is 75 percent complete, at which time the retainage will be reduced to 2.5 percent. However, when the Contractor has completed at least 99 percent of the work, the Owner may, at his discretion, further reduce the retainage to an amount which will be adequate to complete the remaining work plus any anticipated liquidated damage. The Contractor may be required to furnish consent of surety before the retained amount is reduced to less than 2.5 percent.

18. The Geotechnical Reports included as part of this manual were prepared to assist the Owner in preparing the project design. The reports have been included for general information and are not intended to be used to determine the nature of the unclassified materials on the project. The Owner, STV Inc., nor S&ME, guarantee the accuracy or accept liability for information contained there-in. Any use of the geotechnical reports shall be at the Contractor's own risk as it is the Contractor's responsibility to make his own investigations and determinations.

19. The Contractor shall develop and submit prior to beginning construction, a schedule of work which will allow construction of the project while maintaining vehicular access to all adjacent parcels during the construction period.

20. The Contractor shall be responsible for abandoning wells, septic tanks and drain fields in accordance with DHEC and other applicable requirements. Payment for all work associated with the abandonment removal and capping of wells and septic tanks and drain fields shall be included in the clearing and grubbing pay item.

21. The Contractor shall be aware of the following special conditions related to right-of-way settlements with property owners adjacent to the project limits. The Contractor shall be responsible for coordinating with property owners to meet the conditions stipulated below. **The Contractor shall also notify and confirm with the Owner prior to coordination with the property owner:**

22. A summary of the known utilities within the project limits of the project is included in Section 4D: Utilities Special Conditions. While the Owner has coordinated utility relocation work with the utilities prior to the letting of this contract, it will be the successful low bidder's responsibility to coordinate the construction work with the utilities work during construction. The contractor shall provide Utility Staking for all utilities within the project limits to eliminate conflict between the utility and construction activities which will be paid for as pay item 1052001 Utility Staking.

23. For this project, the following will be eligible for adjustments:

    - A.C. Binder Adjustments for Liquid Asphalt Binder (PG 64-22)

    Base date for adjustment will be determined at the Preconstruction meeting dependent on the bid date for this project.

24. Contractor shall comply with all general and regional conditions identified in the nationwide permit.

25. The Contractor shall be liable and responsible for payment of fines assessed by any regulatory agency due to non-compliance with applicable permit requirements and/or regulations by the Contractor. In the event the Owner is fined due to non-compliance with permit requirements, the Owner will charge the Contractor the cost of the fine by deducting the fine amount from the next month's progress pay estimate.

26. The Roadway Boring Logs included as part of the attached Geotechnical Report were prepared to assist the Owner with preparing the project design. They have been included for general information and are not intended to be used to determine the nature of the unclassified materials on the project. The Owner, STV Inc., and S&ME, Inc. does not guarantee the accuracy or accept liability for information contained there-in. This information shall be used at the Contractor's own risk as it is the Contractor's responsibility to make his own investigation and determination of unclassified excavation material.

27. Moving Items – Certain items will need to be moved from within the project limits to allow for the construction of the project. It is the Contractor's responsibility to investigate the various project sites prior to bidding to determine the items requiring removal.

28. Mobilization shall be paid in accordance with Section 103.11 of the SCDOT 2007 Standard Specifications For Highway Construction.

29. The Contractor shall be responsible for abandoning wells, septic tanks and drain fields in accordance with DHEC and other applicable requirements. Payment for all work associated with the abandonment, removal and capping of wells, septic tanks and drain fields shall be included in the Clearing and Grubbing pay item, unless it is provided by other pay items included in this contract.

30. The contractor shall read the Section 404 General Permit included in this Project Manual and comply with all appropriate conditions during construction.

31. The typical pavement section used for the construction of temporary pavement during construction operations shall include the following assumptions:

    H/M ASPHALT SURFACE COURSE TYPE B (200 LB/SY)
    H/M ASPHALT INTERMEDIATE COURSE TYPE B (400 LB/SY)
    H/M ASPHALT BASE COURSE TYPE A (840 LB/SY)

    Quantities for temporary pavement are shown on the General Construction Notes sheet 5 in the plans if noted in the Traffic Control Plans. Should the Contractor determine additional temporary pavement is required it shall be included in the Lum Sum pay item 1071000 Traffic Control.

32. PAYMENT FOR MATERIAL TO BE USED IN THE WORK

    Material Delivered on the Project
    When so authorized by York County/SCDOT, partial payments will be made up to 95% of the delivered cost of materials on hand that are to be incorporated in the work, provided that such materials have been delivered on or in close proximity to the project and stored in an acceptable manner. Material payments will be allowed when 95% of the accumulated costs of unpaid invoices are equal to or greater than $10,000, materials have been inspected and approved by York County/SCDOT

    Material Stored at Fabricator's Facilities or Contractor's Facilities
    When so authorized by York County/SCDOT, partial payments will be made up to 95% of the invoiced cost, exclusive of delivery cost, for bulky materials requiring fabrication at an offsite location that are durable in nature and represent a significant portion of the project cost, if it has been determined by York County/SCDOT, that the material cannot be reasonably stockpiled in the vicinity of the work. Material payments will be allowed when the materials have been inspected and approved by York County/SCDOT

    Materials with Delayed Delivery to the Project
    When so authorized by York County/SCDOT, partial payments will be made up to 95% of the invoiced cost of materials that have been ordered by the contractor but will be more than 45 days before being delivered to the project.

    Required Documents
    (1) Written consent of surety to make such partial payments,
    (2) Bill of Sale from the Contractor to the Department, and
    (3) Copy of invoice from material supplier verifying the cost of the material.

General Requirements

The partial payments will be made on the conditional basis that the material meets the requirements of the contract and will be incorporated into the project. The Contractor shall reimburse the Department for all partial payments for material paid, but not incorporated into the project.

Partial payments for materials on hand or already ordered but not yet delivered to the project will not constitute acceptance, and any faulty material will be rejected even though previous payment may have been made for same in the estimates.

Partial payment will not be made for fuel, supplies, form lumber, falsework, or used materials.

Partial payments will not be made on seed or any living or perishable plant materials except that when such materials have been planted or otherwise incorporated in the work, payment may be made, not as materials, but as work done as part of a contract item for which a contract unit or lump sum price has been established.

Partial payments will not exceed 95% of the contract unit or lump sum prices for the work.

KNOW ALL MEN BY THESE PRESENTS, That I (or we) **COPE/Freedom Ministry F/K/A Coalition of Prison Evangelists, PO Box 1461, Fort Mill, SC 29716,** in consideration of the sum of One Dollar ($1.00), to me (or us) in hand paid, and other valuable consideration at and before the sealing and delivering hereof, do hereby grant to the County of York permission to do the work as outlined below, with the understanding that this work is to be done on property of the Grantor outside of the right of way, it being fully understood and agreed that no right of way is being granted to the County for the purpose of this construction.

SPECIAL PROVISIONS:

Herein granted is permission for construction slopes to extend beyond the right of way on the right of US Route 21 between approximate survey stations 37+90 and 38+80 with the understanding that no additional property is granted for construction slopes, during this construction.

Also, herein granted is permission to use heavy equipment for clearing, placement, maintenance, and access for the purpose of construction of a silt fence for NPDES (National Pollutant Discharge Elimination System) to extend beyond the right of way right of US Route 21, between approximate survey stations 37+90 and 38+80, and right of Fern Forest Court between approximate survey stations 10+80 and 11+00, and the construction of sediment tubes to extend beyond the right of way right of US Route 21, at approximate survey stations 38+04 and 38+52, as shown on the plans for this project with the understanding no additional property is granted for the permission, in accordance with County standards.

Also, herein granted is permission for the County, its contractors, or assigns to use heavy equipment beyond the right of way to demolish or remove the Pine Trees right of approximate survey stations 38+20 and 38+36 US 21 and to remove all materials and debris, during this construction.

Also herein granted is permission for the County to install a drop inlet on the property of the grantor and adjacent to the right of way right of US Route 21 at approximate survey station 38+80, as shown on the plans for this project, during this construction.

York County PID No. 11149-004
Project Name: US Route 21/SC 51
Tract No. 85
PID No. 0042332

KNOW ALL MEN BY THESE PRESENTS, That I (or we) **GTA Properties, LLC, 2707 Huntingtowne Farms Lane, Charlotte, NC 28210** ("Grantor") in consideration of the sum of One Dollar ($1.00), to me (or us) in hand paid, and other valuable consideration at and before the sealing and delivering hereof, do hereby grant to the County of York ("Grantee")permission to do the work as outlined below, with the understanding that this work is to be done on property of the Grantor outside of the right of way, it being fully understood and agreed that no right of way is being granted to the County for the purpose of this construction.

SPECIAL PROVISIONS:

Herein granted is permission for 4 to 1 construction slopes to extend beyond the right of way on the left of US 21 between approximate survey stations 83+80 and 85+96 with the understanding that no additional property is granted for construction slopes, during this construction. The contractor will work the slope around the sign located left of station 84+38 so that it remains in its current location and undisturbed.

Also, it is understood and agreed that a drive entrance to Grantor's property will be constructed left of US 21 at approximate survey station 85+90 during this construction.

The Grantee will restore all areas that are disturbed during or as a result of construction or maintenance activities to a manageable condition. Disturbed areas will be graded to a smooth surface free of ruts, with a uniform slope to prevent ponding, and disturbed areas will be seeded

The Grantee will require the use of protective measures during construction to prevent silting of adjacent creeks and streams. In addition, the Grantee will require the use of traffic control measures including flaggers, as appropriate, when working in the road or driveway. Grantee will require contractor to keep one lane of traffic open during construction at all times.

The Grantee will use at a minimum the following driveway specifications: 150 lbs./SY of asphalt concrete surface course, over 400 lbs./SY of asphalt concrete base course to repair any area of the driveway that is disturbed by this work.

The Grantor shall be responsible for the replacement of all landscaping other than the seeding that the Grantee will perform upon completion of construction.

The Grantor will be allowed to place, at their expense, temporary business signs stating that tenants on the property are Open for Business. Such signs shall not interfere with the Grantee's Contractor's work. The County waives any County permitting fees that would normally apply to these temporary signs (See Attachment "A").

The Grantee will coordinate with its contractors during the pre-construction conference to have minimum impact to the Grantor's tenants' business during business hours throughout construction.

THE STATE OF SOUTH CAROLINA

COUNTY OF YORK

PERMISSION FOR:

Drive

York County PID No. 11149-004
Project Name: US Route 21/SC 51
Tract No. 163
PID No. 0042332

KNOW ALL MEN BY THESE PRESENTS, That I (or we) **McDonalds Real Estate Company, 110 N. Carpenter Street, Chicago, IL 60607-2101 Attn. US Legal Department L/C 039-0773 ("McDonald's")** in consideration of the sum of One Dollar ($1.00), to me (or us) in hand paid, and other valuable consideration at and before the sealing and delivering hereof, do hereby grant to the County of York ("County") permission to do the work as outlined below, with the understanding that this work is to be done on property of the McDonald's outside of the right of way, it being fully understood and agreed that no right of way is being granted to the County for the purpose of this construction.

SPECIAL PROVISIONS:

The proposed work is to tie the new curb and gutter being installed on US Route 21 into the curb and gutter on McDonald's property at its existing curb cut onto US Route 21. If the exiting fire hydrant at the curb cut needs to be relocated to facilitate this work it will be done by and at the expense of County.

It is understood and agreed that a drive entrance will be constructed right of US Route 21 at approximate survey station 132+60 during this construction.

Immediately after County completes the work, County will restore the work area to the same or better condition as it was in before County began the work and to a safe condition, and will remove all of its equipment, tools, trash and debris from the work area.

Unless otherwise agreed in writing, County will not move, remove or demolish any of McDonald's signs, access drives curbing or other improvements located within the work area.

County will separate by cones or other appropriate construction safety barriers ("cone off") the work area while County performs any work in the work area.

County will perform all work in such a manner so as to not unduly disrupt the operation of the McDonald's restaurant on McDonald's property. County will "cone off" no

more than 4 parking stalls at any one time, and will not "cone off" or block in any manner more than half of any access drive at any time, allowing at least one lane open at all times in each access drive for vehicular traffic.

County will not park on or store any construction vehicles, equipment or materials within the work area or on McDonald's other property.

If any damage occurs to McDonald's property or any improvements thereon arising out of, related to, or as a consequence of any of County's work in the work area, McDonald's promptly will notify County in writing of the damage. Unless otherwise agreed by the parties, County will repair the damage (or commence and diligently pursue repairing the damage) within 30 days after receipt of McDonald's notice.

UTILITY SPECIAL PROVISIONS/CONDITIONS
COORDINATION OF RELOCATION WORK WITH HIGHWAY CONSTRUCTION

Widening of US 21 Bypass and SC 51 YORK COUNTY, SC
YORK COUNTY PROJECT – 11149-004 SCDOT PROJECT ID 0042332

Utility As-Builts:

The roadway contractor shall be responsible for the collection and incorporation of the utility as-builts in their final submittal. all existing, proposed, and abandon lines must be shown.

Utility Staking:

Contractor shall be aware on as needed basis; utilities may request staking of construction items and right-of-way to help facilitate relocations and to avoid potential conflict with roadway construction and other utilities.

Utility Relocation Incidentals:

For the relocation of services, adjustments of valve covers and/or manhole lids, adjustments for point conflicts, and any other utility appurtenances adjustments, the contractor shall notify the utility owner 5 days prior to needing adjust and allow 2 weeks to complete.

Utility Relocation Window & Sequence:

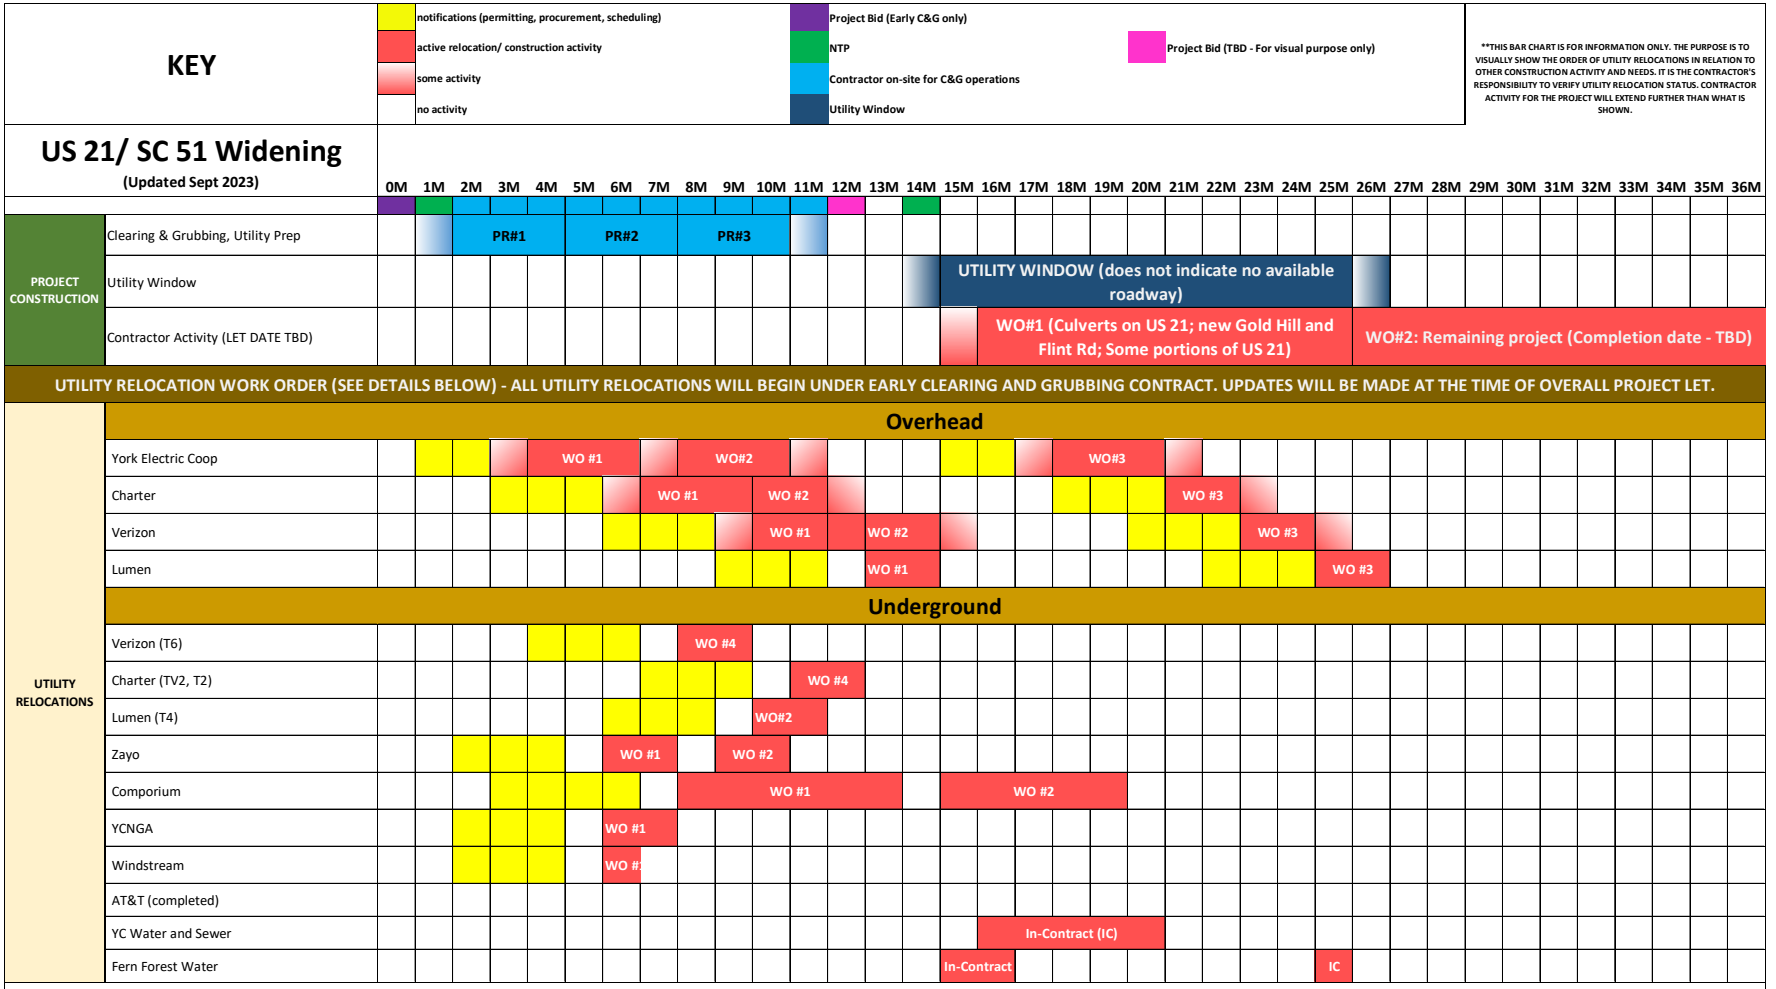
Temporary Suspension for Utility Work and Utility Window:

The County has determined that in the best interest of the traveling public, the contractor shall perform the early utility preparation work as noted in the below table as soon as possible after the award of the contract to allow for utilities to continue with their relocations within a specified 480-day utility window. Once the notice to proceed has been established, the contractor shall begin associated early utility preparation on US 21. Upon completion of the early site preparation and construction staking, the contractor shall notify the RCE by letter. Once the RCE has been notified that early site preparation, erosion control, and staking operations are complete, the utility window shall begin. The RCE shall establish the beginning and end date of the utility windows.

During the utility window, the contractor will not be allowed to perform any work activities unless approved by the RCE. If work activities are approved, they should in no way hinder or interfere with the utility relocations during the utility window provided. If work activities interfere with utility relocations, all work by the prime contractor and subcontractors will be suspended until the end of the utility window.

The contractor shall be responsible for maintaining all erosion control measures on the project. The department will not compensate the contractor for any additional mobilization other than the bid amount for mobilization.

This provision in no way provides a guarantee that all utility relocations will be completed during the utility window.



Utility Relocation Approach:

It is the intention of the utilities to relocate according to the following construction sequence. If the contractor plans to deviate from the proposed phasing, then it is the responsibility of the contractor to coordinate any changes and account for any potential delays.

Contractor will perform early site preparation between Stations 39+50 (Fern Forest Circle) to 45+00 (Forest Drive) RT for the overhead relocations. The early site preparation includes adding fill to approximately 70-80% of the final elevation and grade to drain to allow poles to be set.

It is the intent that utilities will start working in all available locations, where and when possible. The utility window shown is driven by the overhead relocations throughout the project since many are currently underground and converting overhead. If there are locations where existing utilities are not in conflict with proposed roadway work, then the contractor may work in those locations as long as they do not interfere with the utility's ability to install new facilities. These areas are noted below; however, it is the contractor's responsibility to determine if this complies with their own approach. These are examples only.

Existing utilities will remain active until all new facilities are installed and cut over.

WORK AREAS, CONTRACTOR ACTIVITY, AND PRECEDING RELOCATION REQUIRED FOR UTILITY RELOCATION

PERFORMANCE AND INDEMNITY BOND

STATE OF SOUTH CAROLINA
COUNTY OF YORK

KNOW ALL MEN BY THESE PRESENTS that _____ _____ as Principal, hereinafter called Contractor, and _____ _____as Surety, hereinafter called Surety, are held and firmly bound unto the York County Government, as Obligee, hereinafter called owner, in the amount of _____ _____Dollars ($_____) for the payment whereof Contractor and Surety bind themselves, their heirs, executors, administrators, successors and assigns, jointly and severally, firmly by these presents.

WHEREAS, Contractor has by written agreement dated_____, *2025,* entered into a Contract with Owner for:

Pennies for Progress Project 3
Widening of US 21 Bypass and SC 51

in accordance with Drawings and Specifications prepared by York County Engineering Department, ENGINEER, which Contract is by reference made a part hereof and is hereinafter referred to as the Contract.

NOW, THEREFORE, THE CONDITIONS OF THIS OBLIGATION ARE SUCH, that, if the Principal shall in all respects promptly and faithfully perform and comply with the terms and conditions of said Contract and his obligations thereunder and shall indemnify the OWNER and the ENGINEER and save either or all of them harmless against and from all costs, expenses and damages arising from the performance of said Contract or the repair of any work thereunder, then this obligation shall be void; otherwise, this Bond shall remain in full force and effect, in accordance with the following terms and conditions:

A. The Principal and Surety jointly and severally agree to pay the OWNER any difference between the sum to which the said Principal would be entitled on the completion of the Contract, and that sum which the OWNER may be obliged to pay for the completion of said work by Contract or otherwise, and any damages, direct or indirect or consequential, which the said OWNER may sustain on account of such work, or on account of the failure of said CONTRACTOR to properly and in all things, keep and execute all of the provisions of said Contract.

B. And this Bond shall remain in full force and effect for a period of two (2) years from the date of final payment of the project by the OWNER and shall provide that the CONTRACTOR guarantees to repair or replace for said period of one (1) years all work performed and materials and equipment furnished that were not performed or furnished according to the terms of the Contract, and shall make good, defects thereof which have become apparent before the expiration of said period of two (2) years. If any part of the project, in the judgment of the OWNER, for the reasons above stated needs to be replaced, repaired or made good during that time, the OWNER shall so notify the CONTRACTOR in writing. If the CONTRACTOR refuses or neglects to do such work within five (5) days from the date of service of such Notice, the OWNER shall have the work done by others and the cost thereof shall be paid by the CONTRACTOR or his Surety. After the one year warranty period and after all warranty work has been completed satisfactorily to the Owner, the Contractor may request that this Bond be terminated.

C. And the said Surety, for value received hereby stipulates and agrees that no change, extension of time, alteration or addition to the terms of the Contract or to the work to be performed thereunder or the specifications accompanying the same shall in any way affect its obligations on this bond, and it does hereby waive Notice of any change, extension of time, alteration or addition to the terms of the Contract or to the Work or to the Specifications.

D. The surety represents and warrants to the OWNER that they have a minimum Best's Key Rating Guide General Policyholder's Rating of "A –" and Financial Category of "Class VIII".

IN WITNESS WHEREOF, the above bounded parties executed this instrument under their several seals, this ____ day of _____ *2025*, A.D., the name and corporate seal of each corporate party being hereto affixed and these presents duly signed by its undersigned representative, pursuant to authority of its governing body.

PAYMENT BOND

STATE OF SOUTH CAROLINA
COUNTY OF YORK

KNOW ALL MEN BY THESE PRESENTS that _____ _____ as Principal, hereinafter called CONTRACTOR, and _____ as Surety, hereinafter called Surety, are held and firmly bound unto the York County Government, as Obligee, hereinafter called OWNER, in the amount of _____ _____Dollars($_____) for the payment whereof CONTRACTOR and Surety bind themselves, their heirs, executors, administrators, successors and assigns, jointly and severally, firmly by these presents.

WHEREAS, CONTRACTOR has by written agreement dated_____, *2025*, entered into a Contract with OWNER for:

Pennies for Progress Project 3
Widening of US 21 Bypass and SC 51

in accordance with Drawings and Specifications prepared by York County Engineering Department, ENGINEER, which Contract is by reference made a part hereof and is hereinafter referred to as the Contract.

NOW, THEREFORE, THE CONDITIONS OF THIS OBLIGATION ARE SUCH, that, if the Principal shall promptly make payments to all claimants, as herein below defined, then this obligation shall be void; otherwise, this Bond shall remain in full force and effect, subject to the following terms and conditions:

A. A claimant is defined as any person supplying the Principal with labor, material and supplies, used directly or indirectly by the said Principal or any subcontractor in the prosecution of the work provided for in said Contract.

B. The above named Principal and Surety hereby jointly and severally agree with the OWNER that every claimant as herein defined, who has not been paid in full before the expiration of a period of ninety (90) days after performance of the labor or after complete delivery of materials and supplies by such claimant, may sue on this Bond for the use of such claimant, prosecute the suit to final judgment for such sum or sums as may be justly due claimant, and have execution thereon. The OWNER shall not be liable for the payment of any costs or expenses of any such suit.

C. No suit or action shall be commenced hereunder by any claimant:

   1. Unless claimant, other than one having a direct contract with the Principal, shall within forty-five (45) days after beginning to furnish labor, materials or supplies for the prosecution of the work, furnish the Principal with a notice that he intends to look to this bond for protection.

   2. Unless claimant, other than one having a direct contract with the Principal, shall within ninety (90) days after such claimant's performance of the labor or complete

delivery of materials and supplies, deliver to the Principal written notice of the performance of such labor or delivery of such material and supplies and the nonpayment therefore.

3. After the expiration of one (1) year from the performance of the labor or completion of delivery of the materials and supplies; it being understood, however, that if any limitation embodied in this Bond is prohibited by any law controlling the construction hereof such limitations shall be deemed to be amended so as to be equal to the minimum period of limitation permitted by such law.

4. Other than in a state court of competent jurisdiction in and for the county or other political subdivision of the state in which the project, or any part thereof, is situated, or in the United States District Court for the district in which the project, or any part thereof, is situated, and not elsewhere.

D. The Principal and the Surety jointly and severally, shall repay the OWNER any sum which the OWNER may be compelled to pay because of any lien for labor or materials furnished for any work included in or provided by said Contract.

E. The Surety, for value received, hereby stipulates and agrees that no change, extension of time, alteration of or addition to the terms of the Contract or to the work to be performed thereunder or the Specifications applicable thereto shall in any way affect its obligations on this Bond, and the Surety hereby waives notice of any such change, extension of time, alterations of or addition to the terms of the Contract, or to the work or to the Specifications.

F. The Surety represents and warrants to the Owner that they have a minimum Best's Key Rating Guide General Policyholder's rating of "___A -___" and Financial Category of "Class __VIII___".

IN WITNESS WHEREOF, the above bounded parties executed this instrument under their several seals, this _____ day of _____ *2025*, A.D., the name and corporate seal of each corporate party being hereto affixed and these presents duly signed by its undersigned representative, pursuant to authority of its governing body.

My Commission expires: _____

VALUE ENGINEERING INCENTIVE

INTENT AND OBJECTIVE

(1) This Subarticle applies to any cost reduction proposal (hereinafter referred to as a Value Engineering Change Proposal or VECP) initiated and developed by the Contractor for the purpose of refining the contract documents so as to contribute to design cost effectiveness or significantly improve the quality of the end result. This Subarticle does not, however, apply to any such proposal unless it is identified by the Contractor, at the time of its submission to the County, as a proposal submitted pursuant to this Subarticle.

(2) VECPs contemplated are those that would result in net savings to the County by providing either: (A) a decrease in the cost of performance of the Contract, or; (B) a reduction in cost of ownership (hereinafter referred to as collateral costs) of the work provided by this Contract, regardless of acquisition costs. VECPs must result in savings without impairing essential functions and characteristics such as safety, service, life, reliability, economy of operation, ease of maintenance, aesthetics and necessary standard design features. However, nothing herein prohibits the submittal of VECPs where the required functions and characteristics could be combined, reduced or eliminated as being nonessential or excessive. Plan errors which are identified by the Contractor and which result in a cost reduction, will not qualify for submittal as a VECP.

(3) The County reserves the right to reject at its discretion any VECP submitted which proposes a change in the design of the pavement system or which would require additional right-of- way. Substitution of another design alternate, which is detailed in the plans, for the one on which the Contractor bid, will not be allowed under this Subarticle. Pending execution of a formal supplemental agreement, implementing an approved VECP, the Contractor shall remain obligated to perform in accordance with the terms of the existing contract. No time extensions will be granted due to the time required to review a VECP.

SUBCONTRACTORS

(1) The Contractor is encouraged to include the provisions of this Subarticle in contracts with subcontractors. The Contractor shall encourage submission of VECPs from subcontractors, however, it is not mandatory that VECPs be submitted nor is it mandatory that the Contractor accept or transmit to the County VECPs proposed by his subcontractors.

DATA REQUIREMENTS

(1) A description of the difference between the existing contract requirement and the proposed change, and the comparative advantages and disadvantages.

(2) Separate detailed cost estimates for both the existing contract requirement and the proposed change. The cost estimates shall be broken down by contract item numbers indicating quantity increases or decreases and deleted pay items. Additional proposed work, not covered by contract items, shall be identified by current County pay item numbers. In preparing the estimate, the Contractor shall include overhead, profit, and bond. No separate

pay item(s) for these costs will be allowed.

(3) An itemization of plan details, plan sheets, design standards and Specifications that must be changed or added if the VECP is adopted. Preliminary plan drawings must be sufficient to describe the proposed changes.

(4) An estimate of the effects the VECP would have on collateral costs to the County.

(5) Engineering or other analysis in sufficient detail to identify and describe specific features of the contract which must be changed if the VECP is accepted, with a proposal as to how these changes can be accomplished and an assessment of their effect on other project elements. The County may require that engineering analyses be performed by a prequalified consultant in the applicable class of work. Any design changes which result from the VECP must be supported by computations sealed by a Professional Engineer registered in the State of South Carolina.

(6) A statement of the time by which approval of the VECP must be issued by the County to obtain the total estimated cost reduction during the remainder of this Contract, noting any effect on the contract completion time or delivery schedule.

PROCESSING PROCEDURES

(1) Two copies of each VECP shall be submitted, one to the Engineer, or his duly authorized representative, and one to the County's Value Engineering Office. VECPs will be processed expeditiously; however, the County will not be liable for any delay in acting upon a VECP submitted pursuant to this Subarticle. The Contractor may withdraw, in whole or in part, a VECP not accepted by the County within the period specified in the VECP. The County shall not be liable for any VECP development cost in the case where a VECP is rejected or withdrawn.

The Engineer shall be the sole judge of the acceptability of a VECP and of the estimated net savings in construction and/or collateral costs from the adoption of all or any part of such proposal. In determining the estimated net savings, the right is reserved to disregard the contract bid prices if, in the judgment of the Engineer, such prices do not represent a fair measure of the value of work to be performed or to be deleted.

Prior to approval, the Engineer may modify a VECP, with the concurrence of the Contractor, to make it acceptable. If any modification increases or decreases the net savings resulting from the VECP as modified and upon determination of final quantities, the new savings shall be computed by subtracting the revised total cost of all bid items affected by the VECP design from the total cost of the same bid items as represented in the original contract.

Prior to approval of the VECP, which initiates the supplemental agreement, the Contractor shall provide acceptable contract quality plan sheets revised to show all details consistent with the VECP design.

COMPUTATIONS FOR CHANGE IN CONTRACT COST OF PERFORMANCE

Contractor development and implementation costs for the VECP will not be recoverable. If the VECP is adopted, the Contractor's share of the net savings as defined hereinafter shall be considered full compensation to the Contractor for the VECP.

County costs of processing or implementation of a VECP will not normally be considered in the estimate. However, the County reserves the right, where it deems such action appropriate, to require the Contractor to pay the County's cost of investigating and implementing a VECP submitted by the Contractor as a condition of considering such proposal. Where such a condition is imposed, the Contractor shall indicate his acceptance thereof in writing, and such acceptance shall constitute full authority for the County to deduct amounts payable to the County from any monies due or that may become due to the Contractor under the contract.

COMPUTATIONS FOR COLLATERAL COSTS

When collateral cost savings are sought by the Contractor, separate estimates must be prepared for collateral costs of both the existing contract requirement and the proposed change. Each estimate shall consist of an itemized breakdown of all costs and the basis for the data used in the estimate. Cost benefits to the County include, but are not limited to: reduced costs of operation, maintenance or repair, and extended useful service life. Increased collateral costs include the converse of such factors.

Computations shall be as follows:

(1) Costs shall be calculated over a 20-year period on a uniform basis for each estimate.

(2) If the difference in the estimates as approved by the County indicates a savings, the Contractor shall divide the resultant amount by 20 to arrive at the average annual net collateral savings. The resultant savings shall be shared as stipulated in Sharing Arrangements.

SHARING ARRANGEMENTS

If a VECP is approved by the County, the Contractor may be entitled to share in both construction savings and collateral savings to the full extent provided for in this Subarticle.

Except for innovative ideas, the Contractor and County shall each receive 50 percent of net reduction in the cost of performance of this Contract. For innovative ideas, the reduction in the cost of performance shall be shared as follows:

Accrued Net Savings	Contractor's Share %	County's Share %
Less than $25,000	100	0
$25,000 to $50,000	75	25
Over $50,000	50	50

If an approved change is identical or similar to a previously submitted VECP or an idea previously utilized by the County it will not be considered an innovative idea, thus will only qualify for a 50 percent sharing of savings.

When collateral savings occur, the Contractor shall receive 20 percent of the average one year's net collateral savings.

The Contractor shall not receive construction savings or collateral savings on optional work listed in this Contract, until the County exercises its option to obtain that work.

TRAFFIC CONTROL:
The Contractor shall execute the item of Traffic Control as required by the Standard Specifications, the plans, the Standard Drawings For Road Construction, these special provisions, all supplemental specifications, the MUTCD, and the Engineer. This is an amendment to the Standard Specifications to require the following:

GENERAL REGULATIONS -

These special provisions shall have priority to the plans and comply with the requirements of the MUTCD and the standard specifications. Revisions to the traffic control plan through modifications of the special provisions and the plans shall require approval by the department. **Final approval of any revisions to the traffic control plan shall be pending upon review by the Director of Traffic Engineering.**

Install and utilize changeable message signs in all lane closures installed on high volume high-speed multilane roadways. Use of changeable message signs in lane closures installed on low volume low speed multilane roadways is optional unless otherwise directed by the plans and the Engineer. Install and use a changeable message sign within a lane closure set-up as directed by the *Standard Drawings For Road Construction*. When a lane closures is not present for any time to exceed 24 hours, remove the changeable message sign from the roadway. Place the sign in a predetermined area on the project site, as approved by the Engineer, where the sign is not visible to passing motorists. Utilize preprogrammed messages in accordance with the *Standard Drawings For Road Construction* when using the changeable message sign as part of the traffic control set-up for lane closures. Only those messages pertinent to the requirements of the traffic control situation and the traffic conditions are permitted for display on a changeable message sign at all times. At no time will the messages displayed on a changeable message sign duplicate the legends on the permanent construction signs.

During operation of changeable message signs, place the changeable message sign on the shoulder of the roadway no closer than 6 feet between the sign and the near edge of the adjacent travel lane. When the sign location is within 30' of the near edge of a travel lane open to traffic, supplement the sign location with no less than 5 portable plastic drums placed between the sign and the adjacent travel lane for delineation of the sign location. Install and maintain the drums no closer than 3 feet from the near edge of the adjacent travel lane. This requirement for delineation of the sign location shall apply during all times the sign location is within 30' of the near edge of a travel lane open to traffic, including times of operation and non-operation. Oversized cones are prohibited as a substitute for the portable plastic drums during this application.

All signs mounted on portable sign supports shall have a minimum mounting height of 5' from the bottom of the sign to the ground. All signs mounted on ground mounted u-channel posts or square steel tube posts shall have a minimum mounting height of 7' from the bottom of the sign to the grade elevation of the near edge of the adjacent travel lane or sidewalk when a sidewalk is present.

On multilane primary routes, avoid placement of signs mounted on portable sign supports within paved median areas utilized for two-way left turns unless otherwise directed by the RCE.

When mounting signs on multiple ground mounted sign supports, ensure that each post is of the same type. Combining and installing both ground mounted u-section and square steel tube posts within the same sign assembly is prohibited.

When mounting signs on ground mounted u-section or square steel tube posts, utilize either a sign support / ground support post combination with an approved breakaway assembly or a single direct driven post for each individual sign support of a sign assembly installation. Do not combine a sign support / ground support post combination and a direct driven post on the same sign assembly installation that contains two or more sign supports. Regarding sign support / ground support post combination installations, ensure that post lengths, stub heights and breakaway assemblies comply with the manufacturer's requirements and specifications. Use approved breakaway assemblies found on the *Approved Products List For Traffic Control Devices in Work Zones*.

When covering signs with opaque materials, the Department prohibits attaching a covering material to the face of the sign with tape or a similar product or any method that will leave a residue on the retroreflective sheeting. Residue from tape or similar products, as well as many methods

utilized to remove such residue, damages the effective reflectivity of the sign. Therefore, contact of tape or a similar product with the retroreflective sheeting will require replacement of the sign. Cost for replacement of a sign damaged by improper covering methods will be considered incidental to providing and maintaining the sign; no additional payment will be made.

Overlays are prohibited on all rigid construction signs. The legends and borders on all rigid construction signs shall be either reversed screened or direct applied.

Signs not illustrated on the typical traffic control standard drawings designated for permanent construction signs shall be considered temporary and shall be included in the lump sum price bid item for "Traffic Control" unless otherwise specified.

Install "Grooved Pavement" signs (W8-15-48) supplemented with the "Motorcycle" plaque (W8-15P-30) in advance of milled or surface planed pavement surfaces. On primary routes, install these signs no further than 500 feet in advance of the beginning of the pavement condition. On interstate routes, install these signs no less than 500 feet in advance of the beginning of the pavement condition. Install two sign assemblies at each sign location, one on each side of the roadway, on multilane roadways when the pavement condition is present. Install these signs immediately upon creation of this pavement condition and maintain these signs until this pavement condition is eliminated.

Install "Steel Plate Ahead" signs (W8-24-48) in advance of an area of roadway where temporary steel plates are present. Install these signs no further than 300 feet in advance of locations where steel plates are present. On multilane roadways, comply with the same guidelines as applied to all other advance warning signs and install two sign assemblies at each sign location, one on each side of the roadway, when roadway conditions warrant. Install these signs immediately upon installation of a temporary steel plate and maintain the signs until the temporary steel plates are removed.

Install and maintain any necessary detour signing as specified by the typical traffic control standard drawings designated for detour signing, Part VI of the MUTCD, these Special Provisions, and the Engineer. The lump sum price bid item for "Traffic Control" includes payment for installation and maintenance of the detour signing.

The Contractor shall maintain the travel patterns as directed by the traffic control plans and shall execute construction schedules expeditiously. The Contractor shall provide the Resident Engineer with no less than a two-week prior notification of changes in traffic patterns.

During nighttime flagging operations, flaggers shall wear a safety vest and safety pants that comply with the requirements of ANSI / ISEA 107 standard performance for Class 3 risk exposure, latest revision, and a fluorescent hard hat. The safety vest and the safety pants shall be retroreflectorized and the color of the background material of the safety vest and safety pants shall be fluorescent orange-red or fluorescent yellow-green.

During nighttime flagging operations, the contractor shall illuminate each flagger station with any combination of portable lights, standard electric lights, existing street lights, etc., that will provide a minimum illumination level of 108 Lx or 10 fc.

During nighttime flagging operations, supplement the array of advance warning signs with a changeable message sign for each approach. These changeable message signs are not required during daytime flagging operations. Install the changeable message signs 500' in advance of the advance warning sign arrays. Messages should be "Flagger Ahead" and "Prepare To Stop".

During surface planing and milling operations, grade elevation differences greater than 1 inch in areas with pavements composed of hot mixed asphalt (HMA) base courses, intermediate courses or surface courses and Portland cement concrete are PROHIBITED unless otherwise directed by the Department. However, during surface planing and milling operations for removal of Open-Graded Friction courses ONLY, a grade elevation difference of 1½ inches between adjacent travel lanes opened to traffic may exist unless otherwise directed by the Department.

During the paving operations, the length of roadway with an acceptable grade elevation difference less than or equal to 2" shall be restricted to 2 miles.

During the milling and surface planing operations, the length of roadway with an acceptable grade elevation difference less than or equal to 1" shall be restricted to 2 miles.

Supplement and delineate the shoulder edges of travel lanes through work zones with traffic control devices to provide motorists with a clear and positive travel path. Utilize portable plastic drums unless otherwise directed by the Department. Vertical panels may be used where specified by the plans and directed by the RCE. The installation of traffic control devices are required in all areas where those areas immediately adjacent to a travel lane open to traffic have been altered in any manner by work activities, including but not limited to activities such as grading, milling, etc. Install the traffic control devices immediately upon initiating any alterations to the areas immediately adjacent to or within 15 feet of the near edge line of the adjacent travel lane. When sufficient space is available, place the traffic control devices no closer than 3 feet from the near edge of the traffic control device to the near edge line on the adjacent travel lane. When sufficient space is unavailable, place the traffic control device at the maximum distance from the near edge of the adjacent travel lane available.

LANE CLOSURE RESTRICTIONS -

The lane closure restrictions stated below are project specific. For all other restrictions see supplemental specification "Closure Restrictions" dated July 1, 2019.

- **Lane Closure Restriction**
  https://www.scdot.org/business/technicalPDFs/supSpecs/Lane-Closure-Restriction-2019July.pdf
- **Primary Hour Restrictions**
  http://www.scdot.org/business/pdf/accessMgt/trafficEngineering/PrimaryHourRestrictions.pdf
- **Interstate Hour Restrictions**
  https://www.scdot.org/business/pdf/accessMgt/trafficEngineering/InterstateHourRestrictions.pdf

The Contractor shall install all lane closures as directed by the Standard Specifications For Highway Construction (latest edition), the Standard Drawings For Road Construction, these special provisions, the MUTCD, and the Engineer. The Contractor shall close the travel lanes of two-lane two-way roadways by installing flagging operations. The Contractor shall close the travel lanes of multilane primary and secondary routes as directed by the typical traffic control standard drawings designated for lane closures on primary routes.

The Department prohibits lane closures on primary and secondary routes during any time of the day that traffic volumes in the travel lanes remaining open to traffic exceed 800 vehicles per hour per lane per direction. In addition to this restriction the Department specifically restricts lane closures on US 21 & SC 51 & SC 460 & I-77 NB Offramp during the hours listed in the table below. These restrictions also apply to all road closures and pacing operations. The Department reserves the right to suspend a lane closure if any resulting traffic backups are deemed excessive by the Engineer. Maintain all lane closure restrictions as directed by the plans, these special provisions, and the Engineer.

HOURLY LANE CLOSURE PROHIBITIONS (US 21 & SC 51 & SC 460)	HOURLY LANE CLOSURE PROHIBITIONS (I-77 NB Off Ramp)
MON-FRI: 7A-9A and 4P-6P SAT-SUN: N/A	MON-THU: 5A-8P FRI: 5A-9P SAT: 7A-9P SUN: 9A-9P

The contractor is advised that the Lane Closure Restrictions outline in this Traffic Control Special Provision will be strictly enforced. Should lane closures remain in place or not be completely removed by the time specified, a penalty will be assessed at the rate of $500.00 (FIVE HUNDRED DOLLARS) for each hour interval (or any portion thereof).

Flagging operations are considered to be lane closures for two-lane two-way operations and shall be subject to all restrictions for lane closures as specified by this contract.

Lane closures, including flagging operations, are restricted to maximum distances of 2 miles. Install all lane closures according to the typical traffic control standard drawings. On occasions when daytime lane closures must be extended into the nighttime hours, substitute the nighttime lane closure standards for the daytime lane closure standards.

Installation and maintenance of a lane closure is PROHIBITED when the Contractor is not actively engaged in work activities specific to the location of the lane closure unless otherwise specified and approved by the Engineer. The length of the lane closure shall not exceed the length of roadway anticipated to be subjected to the proposed work activities within the work shift time frame or the maximum lane closure length specified unless otherwise approved by the Engineer. Also, the maximum lane closure length specified does not warrant installation of the specified lane closure length when the length of the lane closure necessary for conducting the work activity is less. The length and duration of each lane closure, within the specified parameters, shall require approval by the Engineer prior to installation. The length and duration of each lane closure may be reduced by the Engineer if the work zone impacts generated by a lane closure are deemed excessive or unnecessary.

The presence of temporary signs, portable sign supports, traffic control devices, trailer mounted equipment, truck mounted equipment, vehicles and vehicles with trailers relative to the installation or removal of a closure and personnel are prohibited within the 15 to 30 foot clear zone based upon the roadway speed limit during the prohibitive hours for lane closures specified by these special provisions.

SHOULDER CLOSURE RESTRICTIONS -

The hourly restrictions for lane closures shall also apply to work activities conducted under a shoulder closure within 15' of the near edge of an adjacent travel lane or a median area. The Department reserves the right to suspend work conducted under a shoulder closure if any traffic backups develop and are deemed excessive by the Engineer. Maintain all shoulder closure restrictions as directed by the plans, these special provisions, and the Engineer.

On primary and secondary roadways, the Department prohibits the Contractor from conducting work within 1' or less of the near edge of an adjacent travel lane under a shoulder closure. All work that may require the presence of personnel, tools, equipment, materials, vehicles, etc., within 1' of the near edge of an adjacent travel lane shall be conducted under a lane closure.

The Contractor shall install all shoulder closures as directed by the typical traffic control standard drawings designated for shoulder closures, and the Engineer. Substitution of the portable plastic drums with oversized cones during nighttime shoulder closures is PROHIBITED.

MOBILE OPERATIONS -

A mobile operation moves continuously at all times at speeds 3 mph or greater without any stops. The minimal traffic flow impacts generated by these operations involve brief traffic flow speed reductions and travel path diversions. Conduct work operations that cannot be performed at speeds of 3 mph or greater under standard stationary lane closures.

The distance intervals between the vehicles, as indicated in the *Standard Drawings For Road Construction*, may require adjustments to compensate for sight distance obstructions created by hills and curves and any other conditions that may obstruct the sight distance between the vehicles. However, adjustments to the distance intervals between the vehicles should be maintained within the range of variable distance intervals indicated in the standard drawings unless otherwise directed by the Engineer.

Maintain two-way radio communication between all vehicles in the vehicle train operating in a mobile operation.

Supplement the work vehicles and the shadow vehicles with amber colored flashing dome lights. The vehicles may also be supplemented with advance warning arrow panels and truck mounted attenuators as directed in the *Standard Drawings For Road Construction* and the Standard Specifications.

The Contractor shall install, operate and maintain all advance warning arrow panels, truck mounted attenuators and truck mounted changeable message signs as required by these special provisions, the manufacturer's specifications, the *Standard Drawings For Road Construction*, the Standard Specifications, the plans and the Engineer.

CHANGES TO INTERSECTION TRAFFIC CONTROL -

(A) Traffic Signal to Two-Way Stop Control –

1. Approximately two weeks prior to the date the change is to be implemented:

   a. On the approaches that will be uncontrolled, install changeable message signs having the messages "SIGNAL WILL BE REMOVED" and "ON XX/XX" (XX/XX is the removal date in month/day format).

   b. On the approaches to which stop control will be installed, erect signs (R24-2-36) giving notice that a stop will be effective on a specific date. The signs may be erected below or adjacent to the SIGNAL AHEAD signs on the stop approaches.

2. An explanation of the change should be provided by public notice to the local news media approximately one week in advance of the date the change is to be implemented.

3. On the date of the change, the following steps should be done:

   a. Erect STOP signs and signs having the message CROSS TRAFFIC DOES NOT STOP (W4-4P-XX) below or adjacent to the STOP signs on approaches that are to be stop approaches. Erect STOP AHEAD signs on approaches that are to be stop approaches.

   b. Place the traffic signal into flash mode. Flash yellow on approaches where traffic is not required to stop. Flash red on the stop approaches.

   c. Remove SIGNAL AHEAD signs on all approaches.

   d. Remove R24-2-36 signs and changeable message signs that were used to give notice of the change in traffic control.

   e. Pavement markings on the new through street should be corrected by removing any stop lines that exist.

4. The traffic signal should flash for seven days. After seven days the signal should be disconnected and all signal heads removed. If all signal heads cannot be removed in a single work day the remaining signal heads may be bagged until their removal. All signal heads shall be removed within seven days of the signal being disconnected.

5. Signs with the message CROSS TRAFFIC DOES NOT STOP should remain in place a minimum of two months after the date of the change.

TRAFFIC CONTROL PROCEDURES SPECIFIC TO TRAFFIC SIGNAL WORK OPERATIONS –

Utilize a vehicle train consisting of a primary work vehicle and no less than 1 shadow vehicle. The shadow vehicle is required for all Traffic Signal Work Operations except on a two-lane roadway for a time duration of 15 minutes or less when no pedestrian workers are present, excluding the flagger. A second shadow vehicle is necessary in some applications on multilane roadways as depicted on the Standard Drawings. Install and maintain the vehicle train as directed by these special provisions, the Standard Drawings For Road Construction, and the Engineer.

Two-Lane Two-Way Roadways

A. Utilize flagging operations to control the traffic flow around the work site where the vehicle train is operating.

B. Utilize flaggers to control the traffic flow on an intersecting two-lane two-way roadway. The advance warning signs for the flagging operations shall include the following:

W20-7a-48	Flagger symbol
W20-4-48-A	One Lane Road Ahead
W20-1-48-A	Road Work Ahead

C. Maintain two-way radio communications between all flaggers.

Multilane Roadways

A. During work operations that require the vehicle train to encroach upon or operate within the limits of a travel lane for a time duration of 15 minutes or less, advance warning signs may be omitted.

B. During work operations that require the vehicle train to encroach upon or operate within the limits of a travel lane for a time duration in excess of 15 minutes but less than 60 minutes, advance warning signs are required. Typical advance warning signs required for a temporary closure of a travel lane shall include the following:

W4-2R(L)-48	Lane Ends symbol
W20-5R(L)-48-A	Right (Left) Lane Closed Ahead
W20-1-48-A	Road Work Ahead

C. Utilization of flaggers to control the traffic flow in the travel lanes adjacent to the travel lane the vehicle train is operating in is PROHIBITED except as allowed in the Standard Drawings Requirements for a Temporary Cessation of Traffic Flow for a time duration of 3 minutes or less.

D. Utilize flaggers to control the traffic flow on an intersecting two-lane two-way roadway. Only flaggers and advance warning signs are required on the approaches intersecting the travel lane the vehicle train is operating in. The advance warning signs for the flagging operations shall include the following:

W20-7a-48	Flagger symbol
W3-4-48	Be Prepared to Stop
W20-1-48-A	Road Work Ahead

E. **During work operations that require the vehicle train to encroach upon or operate within the limits of a travel lane for a time duration in excess of 60 minutes, install a standard lane closure as directed by these special provisions, the Standard Drawings For Road Construction, and the Engineer.**

Conduct all equipment and material preparations prior to entering the roadway.

Conducting traffic signal work or conducting any activities that interfere with or create disruptions to normal traffic operations during morning, mid-day, and afternoon-evening high traffic volume peak periods is PROHIBITED. The contractor shall observe all lane closure restrictions.

Conduct all work activities within the boundaries of a travel lane closed to vehicular traffic or a pedestrian thoroughfare closed to pedestrian traffic. Conducting work activities over a travel lane open to traffic is PROHIBITED. Conducting work activities over a pedestrian thoroughfare open to pedestrian traffic is PROHIBITED. Do not conduct any work activities in any manner over a thoroughfare open to vehicular or pedestrian traffic.

When advance warning signs are required to supplement the vehicle train, install the advance warning signs at spacing intervals based on the regulatory speed limit of the roadway prior to beginning any work. When a work zone traffic control plan or a work zone traffic control standard drawing is not provided to indicate the spacing intervals for a typical 3 advance warning sign array installation, utilize the sign placement intervals below. **These sign intervals do not apply to the sign intervals of the advance sign intervals for standard lane closures.**

ADVANCE WARNING SIGN PLACEMENT INTERVALS	
URBAN / RURAL (LOW SPEED) ≤ 35 MPH	200 / 200 / 200 Feet
URBAN / RURAL (INTERMEDIATE SPEED) 40 - 50 MPH	350 / 350 / 350 Feet
RURAL (HIGH SPEED) ≥ 55 MPH	500 / 500 / 500 Feet
INTERSTATE	1000 / 1500 / 2600 Feet

TYPICAL TRAFFIC CONTROL STANDARD DRAWINGS -

The typical traffic control standard drawings of the "Standard Drawings For Road Construction", although compliant with the MUTCD, shall take precedence over the MUTCD. The typical traffic control standard drawings of the "Standard Drawings For Road Construction" shall apply to all projects let to contract.

Install the permanent construction signs as shown on the typical traffic control standard drawings designated for permanent construction signing.

ADDENDUMS

(Addendums to the "2007 Standard Specifications for Highway Construction")

(A) Construction (Sub-section 601.4) –

Sub-section 601.4.2 Construction Vehicles (paragraph 2) -

When working within the rights-of-way of access-controlled roadways such as Interstate highways, the Contractor's vehicles may only change direction of travel at interchanges. These vehicles are prohibited from crossing the roadway from right side to the median or vice versa. Use a flagger to control the Contractor's vehicles when these vehicles attempt to enter the roadway from a closed lane or the median area. Ensure the flagger does not stop roadway traffic, cause roadway traffic to change lanes, or affect roadway traffic in any manner. The Contractor's vehicles may not disrupt the normal flow of roadway traffic or enter the travel lane of the roadway until a sufficient gap is present.

The Contractor shall have flaggers available to control all construction vehicles entering or crossing the travel lanes of secondary and primary routes. The RCE shall determine the necessity of these flaggers for control of these construction vehicles. The RCE shall consider sight distance, vertical and horizontal curves of the roadway, prevailing speeds of roadway traffic, frequency of construction vehicles entering or crossing the roadway and other site conditions that may impact the safety of the workers and motorists when determining the necessity of these flaggers. Ensure these flaggers do not stop roadway traffic, cause roadway traffic to change lanes or affect roadway traffic in any manner. The Contractor's vehicles may not disrupt the normal flow of roadway traffic or enter the travel lane of the roadway until a sufficient gap is present.

When working within the rights-of-way of access-controlled roadways with posted regulatory speed limits of 55 MPH or greater and average daily traffic volumes {ADT} of 10,000 vehicles per day or greater, i.e. Interstate highways, all construction and work vehicles possessing any one or more of the vehicular characteristics listed below are only permitted to enter and exit a right or left shoulder work area during the presence of active lane closures unless otherwise directed by the RCE. These vehicles are not permitted to enter or exit these work areas without the presence of active lane closures unless otherwise directed by the RCE. Shoulder closures are unacceptable and insufficient methods for control of traffic at ingress / egress areas for these vehicles. The restrictive vehicular characteristics include the following:

- Over six (6) tires
- Tandem rear axles
- A base curb weight greater than 8000 lbs.
- A gross vehicular weight greater than 12000 lbs. unless performing duties as a shadow vehicle while supporting a truck mounted attenuator
- A trailer in tow except under the following conditions:
    - Trailers transporting traffic control devices (including but not limited to standard and 42" oversized traffic cones, portable plastic drums, signs, portable sign supports, u-channel and square steel tube sign posts) relative to the installation of lane closures, shoulder closures or other traffic control operations approved by the RCE
    - Trailer mounted traffic control devices (including but not limited to advance warning arrow panels, changeable message signs, temporary traffic signals, highway advisory radios, work zone intelligent transportation systems and trailer towed truck mounted attenuators)

(B) <u>Construction</u> (Sub-section 601.4) –

<u>Sub-section 601.4.2 Construction Vehicles</u> -

<u>Auxiliary Warning Lights for Vehicles and Equipment</u> -

Supplement all construction and/or construction-related vehicles and equipment that operate in a stationary or mobile work zone within or adjacent to a roadway within the highway rights-of-way with AMBER or YELLOW colored high intensity rotating or strobe type flashing auxiliary warning light devices. Utilize, install, operate and maintain a single or multiple lighting devices as necessary to provide visibility to approaching motorists.

All auxiliary warning light models shall meet *Society of Automotive Engineers* (SAE) Class I standards and SAE Standard J575 relative to *Tests for Motor Vehicle Lighting Devices and Components* and these specifications.

The amber/yellow color of the dome/lens of an auxiliary warning light device shall meet SAE Standard J578 for amber/yellow color specifications.

Auxiliary warning lights with parabolic reflectors that rotate shall rotate around a halogen lamp at a rate to produce approximately 175 flashes per minute. The parabolic reflector shall produce a minimum 80,000 candle power and a minimum 54,000 candela through an SAE Standard J846 approved amber dome.

Equip strobe type flashing auxiliary warning light devices with photosensitive circuit controls to adjust the lighting intensity in response to changes in ambient light conditions such as from day to night. These lights shall have a double-flash capability rated at approximately 80 double flashes per minute and produce a minimum 24 joules of flash energy at the highest power level setting.

Acceptable auxiliary warning light models shall provide sufficient light output to be clearly recognizable at a minimum distance of 1750 feet.

Mount all auxiliary warning light devices intended to function as the auxiliary warning light system or as an element thereof on vehicles and equipment at locations no less than 3 feet above the ground and in conspicuous locations to provide visibility to approaching motorists.

Auxiliary warning light devices and/or models that mount in the locations of the standard vehicle lighting system are unacceptable as the specified auxiliary warning light system due to restrictive simultaneous visibility capabilities from multiple sight angles. However, auxiliary warning light devices that mount in the standard vehicle lighting system locations are acceptable as supplements to the specified lighting devices mounted in locations that do meet the minimum height requirements and provide simultaneous visibility capabilities from multiple sight angles.

Standard vehicle hazard warning lights are only permitted as supplements to the specified auxiliary warning light devices.

(C) General Requirements for Providing and Maintaining Traffic Control Devices in the Work Zone (Section 602) –

Sub-section 602.4 Construction (paragraph 8) -

Mount flat sheet signs straight and level and with the face of the signs perpendicular to the surface of the roadway. This requirement applies to flat sheet signs whether they are portable or have the embedded supports. Mount advance construction signs 2 feet from the edge of a paved shoulder or the face of a curb, or if no paved shoulder exists, 6 feet to 12 feet from the edge of an adjacent travel lane to the nearest edge of the signs. The mounting height of single signs mounted on ground embedded sign supports is no less than 7 feet or no greater than 8 feet from the bottom edge of the sign to the grade elevation of the near edge of the adjacent travel lane or sidewalk when a sidewalk is present. Any secondary sign on the same assembly has a minimum mounting height of 6 feet from the ground to the bottom edge of the secondary sign. Ensure that signs mounted on portable sign supports, including advance construction signs, regulatory signs, warning signs, etc., have a minimum mounting height of 5 feet from the ground to the bottom edge of the sign. Provide special sign mounting assemblies, when necessary, in areas of double-layered guardrail, concrete median barrier, or bridge parapet walls.

(D) Category I Traffic Control Devices (Section 603) –

Sub-section 603.2.2 Oversized Traffic Cones (paragraph 6) -

Reflectorize each oversized traffic cone with 4 retroreflective bands: 2 orange and 2 white retroreflective bands. Alternate the orange and white retroreflective bands, with the top band always being orange. Make each retroreflective band not less than 6 inches wide. Utilize Type III – Microprismatic retroreflective sheeting for retroreflectorization on all projects let to contract after May 1, 2010 unless otherwise specified. Separate each retroreflective band with not more than a 2-inch non-reflectorized area. Do not splice the retroreflective sheeting to create the 6-inch retroreflective bands. Apply the retroreflective sheeting directly to the cone surface. Do not apply the retroreflective sheeting over a pre-existing layer of retroreflective sheeting.

Sub-section 603.2.3 Portable Plastic Drums (paragraph 3) -

Reflectorize each drum with Type III – Microprismatic retroreflective sheeting: 2 orange and 2 white retroreflective bands, 6 inches wide on all projects let to contract after May 1, 2010 unless otherwise specified. Alternate the orange and white retroreflective bands with the top band always being orange. Ensure that any non-reflectorized area between the orange and white retroreflective bands does not exceed 2 inches. Do not splice the retroreflective sheeting to create the 6-inch retroreflective bands. Apply the

retroreflective sheeting directly to the drum surface. Do not apply the retroreflective sheeting over a pre-existing layer of retroreflective sheeting.

(E) Category II Traffic Control Devices (Section 604) –

Sub-section 604.2.1 Type I and Type II Barricades (paragraph 3) -

Reflectorize these barricades with Type VIII or IX Prismatic retroreflective sheeting on all projects let to contract after May 1, 2012 unless otherwise specified. Ensure that the retroreflective sheeting has alternate orange and white stripes sloping downward at a 45-degree angle in the direction of passing traffic. The stripes shall be 6 inches wide.

Sub-section 604.2.2 Type III Barricades (paragraph 3) -

Reflectorize these barricades with Type VIII or IX Prismatic retroreflective sheeting on all projects let to contract after May 1, 2012 unless otherwise specified. Ensure that the retroreflective sheeting has alternate orange and white stripes sloping downward at a 45-degree angle. Apply the sloping orange and white stripes in accordance with the requirements of the Plans, SCDOT Standard Drawings and the MUTCD. The stripes shall be 6 inches wide.

(F) Temporary Concrete Barrier (Sub-section 605.2.3.2) –

Sub-section 605.2.3.2 Temporary Concrete Barrier (paragraph 6) -

Previously used temporary concrete barrier walls are subject to inspection and approval by the RCE before use. Ensure that previously used temporary concrete barrier walls are in good condition. Defects to a temporary concrete barrier wall that may disqualify a section of wall for use include gouges, cracks, chipped, or spalled areas. A defect that exposes reinforcing steel warrants immediate disqualification. A disqualification grade type defect shall consist of measurements in excess of 1 inch, entirely or partially within the boundaries of the end connection areas and the drainage slot areas as illustrated in the “Standard Drawings for Road Construction”, and/or in excess of 4 inches for all areas beyond the end connection areas. To warrant disqualification, these measurements shall exceed the specified dimensions in all three directions, width, height, and depth. A defect that exceeds the specified dimensions in only one or two of the three directions does not warrant disqualification.

Temporary concrete barrier walls with defects less than 6 inches in all three directions, width, height, and depth that do not expose reinforcing steel may be repaired in accordance with the following requirements. Repair is prohibited on temporary concrete barrier walls with defects 6 inches or greater in all three directions, width, height and depth.

For repair of temporary concrete barrier walls with defects less than 6 inches in all three directions, width, height, and depth that do not expose reinforcing steel, repair the defect with a premanufactured patching material specifically fabricated for patching structural concrete. The strength of the patch must meet or exceed the design strength of the class 3000 concrete of the temporary concrete barrier wall. Perform the repair procedures in accordance with all requirements and instructions from the manufacturer of the patch material. Use a bonding compound between the patch material and the concrete unless specifically stated by the manufacturer that a bonding compound is not required. If the manufacturer states that application of a bonding compound is optional, SCDOT requires application of a bonding compound compatible with the patch material. If cracking occurs within the patched area, remove the patch material completely and repeat the repair process. The contractor shall submit documentation stating all repairs have been conducted in accordance with these requirements prior to installing any temporary concrete barrier walls with repairs. Utilization of temporary concrete barrier walls with repairs shall require approval by the RCE prior to installation.

The Contractor shall submit certification documents for the patch material utilized for repairs to the Engineer prior to placing temporary concrete barrier walls that have been repaired on the project site.

Sub-section 605.2.3.2 Temporary Concrete Barrier (paragraph 5) -

In regard to projects let to contract after January 1, 2017, ALL *NCHRP Report 350* compliant temporary concrete barrier walls placed on a project site SHALL comply with the requirements for the recessed approval stamp as directed by the *SCDOT Standard Drawings*. Those *NCHRP Report 350* compliant temporary concrete barrier walls with the original recessed approval stamp that reads "SCDOT 350" will continue to be acceptable on projects let to contract after January 1, 2017. However, those temporary concrete barriers with the “SCDOT 350” identification plate attached to the side of the barrier walls with mechanical anchors previously grandfathered will no longer be acceptable on projects let to contract after January 1, 2017.

(G) Construction Signs (Sub-section 605.4.1.1) –

On all projects relative to **interstate highways** let to contract after January 1, 2016, all signs attached to portable sign supports on and/or adjacent to **interstate highways** shall be rigid. Fabricate each of these rigid signs from an approved aluminum laminate composite rigid sign substrate approved by the Department. Utilization of signs fabricated from roll-up fabric substrates attached to portable sign supports installed on and/or adjacent to **interstate highways** will no longer be acceptable on projects let to contract after January 1, 2016.

ONLY those portable sign supports specified and approved for support of rigid signs fabricated from approved aluminum laminated composite rigid sign substrates and included on the *Approved Products List for Traffic Control Devices in Work Zones*, latest edition, are acceptable. To facilitate location of acceptable portable sign supports, the listing of portable sign supports is now separated into two (2) sections; “Portable Sign Supports for Use with Roll-Up Signs ONLY” and “Portable Sign Supports for Use with Roll-Up Sign Substrates and Rigid Sign Substrates”.

The trade names of the approved aluminum laminate composite rigid sign substrates are “Acopan”, “Alpolic”, “Dibond” and “Reynolite”. These rigid sign substrates are restricted to thicknesses no greater than 2 millimeters.

Rigid signs fabricated from standard aluminum sign blanks or any other rigid material other than Acopan, Alpolic, Dibond or Reynolite are PROHIBITED for attachment to portable sign supports. However, rigid signs fabricated from standard 0.080 and 0.100 inches thick aluminum sign blanks will continue to be acceptable for mounting on ground mounted sign supports.

Signs fabricated from roll-up fabric substrates approved by the Department will continue to be acceptable for use on and/or adjacent to secondary and primary roadways unless otherwise directed by the Department.

The minimum mounting height of signs mounted on these portable sign supports shall continue to be 5 feet from the ground to the bottom edge of the sign except where a minimum 7 foot mounting height is required in accordance with the standard specifications, the standard drawings, these special provisions and the MUTCD, latest edition.

(H) Truck-Mounted Attenuator (Sub-section 605.4.2.2) –

Sub-section 605.2.2.2.3.3 Color (paragraph 1) -

Use industrial grade enamel paint for cover of the metal aspects of the unit. Provide and attach supplemental striping to the rear face of the unit with a minimum Type III high intensity retroreflective sheeting unless otherwise directed by the Department. Utilize an alternating 4 to 8 inch black and 4 to 8 inch yellow 45-degree striping pattern that forms an inverted “V” at the center of the unit that slopes down and to the sides of the unit in both directions from the center.

(I) Truck-Mounted Attenuator (Sub-section 605.4.2.2) –

Sub-section 605.4.2.2 Truck-Mounted Attenuators (paragraph 6) -

A direct truck mounted truck mounted attenuator is mounted and attached to brackets or similar devices connected to the frame of a truck with a minimum gross vehicular weight (GVW) of 15,000 pounds (actual weight) unless otherwise directed. A trailer towed truck mounted attenuator is towed from behind and

attached via a standard pintle hook / hitch to the frame of a truck with a minimum gross vehicular weight (GVW) of 10,000 pounds (actual weight) unless otherwise directed.

Each truck utilized with a truck mounted attenuator shall comply with the manufacturer's requirements to ensure proper operation of the attenuator. The minimum gross vehicular weight (GVW) (actual weight) for each truck shall comply with these specifications unless otherwise directed within the "Remarks" column of the *Approved Products List For Traffic Control Devices in Work Zones* in regard to specific requirements for the device in question.

If the addition of supplemental weight to the vehicle as ballast is necessary, contain the material within a structure constructed of steel. Construct this steel structure to have a minimum of four sides and a bottom to contain the ballast material in its entirety. A top is optional. Bolt this structure to the frame of the truck. Utilize a sufficient number of fasteners for attachment of the steel structure to the frame of the truck to ensure the structure will not part from the frame of the truck during an impact upon the attached truck mounted attenuator. Utilize either dry loose sand or steel reinforced concrete for ballast material within the steel structure to achieve the necessary weight. The ballast material shall remain contained within the confines of the steel structure in its entirety and shall not protrude from the steel structure in any manner.

(J) Trailer-Mounted Changeable Message Signs (Sub-section 606.3.2) -

Sub-section 606.3.2.7 Controller (paragraphs 1-4) -

The controller shall be an electronic unit housed in a weatherproof, rust resistant box with a keyed lock and a light for night operation. Provide the unit with a jack that allows direct communications between the on-board controller and a compatible personal computer. The unit shall have a LCD display screen that allows the operator to review messages prior to displaying the message on the sign.

The controller shall have the capability to store 199 factory preprogrammed messages and up to 199 additional messages created by the user in a manner that does not require a battery to recall the messages. Also, the controller shall allow the operator the capability to program the system to display multiple messages in sequence.

Provide the controller with a selector switch to allow the operator to control the brightness or intensity level of the light source of the sign panel. The selector switch shall include "bright," "dim" and "automatic" modes; inclusion of additional modes is permissible. When the selector switch is in the "automatic" mode, a photosensitive circuit shall control the brightness or intensity level of the light source in response to changes in ambient light such as from day to night and other various sources of ambient light.

Equip each sign with remote communications capabilities, such as utilization of cellular telephone or internet browser technology, to allow the operator to revise or modify the message selection from the office or other remote location. Also, provide protection to prohibit unauthorized access to the controller, (i.e. password protection).

Sub-section 606.5 Measurement (paragraph 2) -

Trailer-mounted changeable message signs are included in the lump sum item for Traffic Control in accordance with **Subsections 107.12** and **601.5** of the "2007 Standard Specifications for Highway Construction". No separate measurement will be made for trailer-mounted changeable message signs unless the contract includes a specific pay item for trailer-mounted changeable message signs.

The Contractor shall provide, install, operate, and maintain the trailer-mounted changeable message sign per traffic control set-up as directed by the Plans, the "Standard Drawings for Road Construction", these Special Provisions, the Specifications, and the Engineer.

Sub-section 606.6 Payment (paragraph 2) -

In addition to **Subsections 107.12** and **601.6**, the payment for Traffic Control is full compensation for providing, installing, removing, relocating, operating, and maintaining trailer-mounted advance warning arrow panels and trailer-mounted changeable message signs as specified or directed and includes providing the units' primary power source; repairing or replacing damaged or malfunctioning units within the specified time;

providing traffic control necessary for installing, operating, and maintaining the units; and all other materials, labor, hardware, equipment, tools, supplies, transportation, incidentals, and any miscellaneous items necessary to fulfill the requirements of the pay item in accordance with the Plans, the Specifications, and other items of the Contract.

Sub-section 606.6 Payment (paragraph 3) -

Disregard this paragraph unless the Contract includes a specific pay item for trailer-mounted changeable message signs.

(K) Temporary Pavement Markings (Sub-section 609.4.1) –

Sub-section 609.4.1.1.1 Application Requirements General (in addition to paragraph 3) -

On two-lane two-way roadways, apply and place temporary or permanent pavement markings, as specified hereupon, prior to the end of each day's work or shift or reopening a closed travel lane to traffic. These pavement markings shall include 4-inch wide solid lines on edge lines and solid center lines and 4-inch wide by 10 feet long broken lines with a 30-foot gap for broken center lines and lane lines unless otherwise specified. The center line pavement markings shall be either double yellow solid lines, yellow broken lines or an appropriate combination of a yellow solid line and yellow broken lines for passing / no passing zones. Placement of a singular yellow solid line for a center line pavement marking is unacceptable. The edge line pavement markings shall be a white solid line.

On multilane primary and secondary roadways, apply and place temporary or permanent pavement markings, as specified hereupon, to the travel lanes prior to reopening a closed travel lane to traffic. These pavement markings shall include 4-inch wide solid lines, utilized for edge lines and solid center lines, and 4-inch wide by 10 feet long broken lines with a 30-foot gap, utilized for lane lines and turn lanes, unless otherwise specified. The center line pavement markings shall be either double yellow solid lines or an appropriate combination of a yellow solid line and 4-inch wide by 10 feet long yellow broken lines for two-way left turn median areas. The right edge line pavement markings shall be a white solid line and the left edge line shall be a yellow solid line except in areas where the travel lanes separate to create a gore type situation and then the color schemes shall comply with SCDOT application practices for gore areas. The lane lines between travel lanes and turn lanes shall be 4-inch wide by 10 feet long white broken lines with a 30-foot gap.

However, on two-lane two-way and multilane primary and secondary roadways, application of a 4-inch wide solid line utilized for an edge line adjacent to an earth shoulder, white or yellow, may be delayed up to 72 hours after eradication of the original line when the length of eradicated line at a single location is no longer than 250 feet. In the event of multiple locations along the same line, each location must be separated from the adjacent location by no less than 250 feet with a cumulative total distance of eradicated line of no more than 1300 feet within any continuous 1 (one) mile length of roadway measured from a selected location. If the length of eradicated line exceeds 250 feet at any single location, the distance interval between multiple adjacent locations is less than 250 feet or a cumulative total distance of multiple locations of eradicated line exceeds 1300 feet within any continuous 1 (one) mile length of roadway measured from a selected location, replace the eradicated line(s) prior to reopening the adjacent travel lane to traffic.

On interstate roadways, apply and place temporary or permanent pavement markings, as specified hereupon, to the travel lanes prior to reopening a closed travel lane to traffic. These pavement markings shall include 6-inch wide solid lines, utilized for edge lines, and 6-inch wide by 10 feet long white broken lines with a 30-foot gap, utilized for lane lines between travel lanes and auxiliary lanes, unless otherwise specified. The right edge line pavement markings shall be a white solid line and the left edge line shall be a yellow solid line except in areas where the travel lanes separate to create a gore type situation and then the color schemes shall comply with SCDOT application practices for gore areas.

On all roadways, apply and place white stop bars and white triangle yield bars in all locations where previous stop bars and triangle yield bars have been eradicated by the work. Apply and place white stop bars and white triangle yield bars at intersections controlled by stop and yield signs within 72 hours of the eradication of the original pavement marking. Apply and place white stop bars at signalized intersections controlled by traffic control signals and at railroad crossings prior to reopening a closed travel lane to traffic.

Within the limits of existing turn lanes on all roadways, apply and place white arrows in all locations where previous arrows have been eradicated by the work unless otherwise directed by the RCE. Apply and place white arrows within 72 hours of the eradication of the original pavement markings. However, in regard to newly constructed turn lanes, apply and place white arrows the within turn lanes as directed by the RCE.

Within the limits of existing lane-drop sites on all roadways, apply and place white arrows in all locations where previous arrows have been eradicated by the work prior to the end of each day's work or shift or reopening the closed travel lane to traffic. In regard to newly constructed lane-drop sites, apply and place white arrows within the travel lane to be terminated prior to opening the travel lane to traffic and as directed by the RCE.

(L) Temporary Pavement Markings (Sub-section 609.4.1) –

Sub-section 609.4.1.1.1 Application Requirements General (Revision to paragraph 8) -

On two-lane, two-way roadways, passing zones may be eliminated within the work zone through application of 4-inch double yellow centerline pavement markings if determined feasible and directed to do so by the Plans and/or the RCE. Apply no passing zone markings as specified by the Plans, the Specifications, the *MUTCD* and the RCE.

(M) Flagging Operations (Sub-section 610.4.1) –

Sub-section 610.4.1.1 Flagging Operations (paragraph 1) -

Use a flagging operation to control the flow of traffic when two opposing directions of traffic must share a common travel lane. A flagging operation may be necessary during a lane closure on a two-lane two-way roadway, an intermittent ramp closure or an intermittent encroachment of equipment onto a portion of the roadway. Utilize flagging operations to direct traffic around work activities and maintain continuous traffic flow at reduced speeds when determined to be appropriate by the RCE. As stated above, flagging operations shall direct traffic around the work activities and maintain continuous traffic flow, therefore, stopped traffic shall not be required to stop for time durations greater than those listed below unless otherwise directed by the RCE. Begin measurement of the time interval immediately upon the moment the Flagger rotates the Stop/Slow paddle to display the "Stop" condition to the approaching motorists.

LENGTH OF CLOSURE	MAXIMUM TIME DURATION FOR STOPPED TRAFFIC
1 MILE or LESS	5 Minutes
1 to 2 MILES	7 ½ Minutes

If the work activities require traffic to be stopped for periods greater than 5 to 7 ½ minutes as stated above, consider alternate work methods, conducting work activities during times of lowest traffic volumes such as during the hours of darkness or complete road closure with detour installation.

(N) Paving and Resurfacing (Sub-section 611.4.1) –

Sub-section 611.4.1.2 Requirements (paragraph 8) -

Whenever travel lanes with acceptable grade elevation differences are open to traffic, provide "Uneven Lanes" signs (W8-11-48) or "Uneven Pavement" signs (W8-11A-48). Reflectorize these signs with a fluorescent orange colored prismatic retroreflective sheeting unless otherwise specified. Install these signs adjacent to roadways with uneven pavement surfaces between travel lanes or between travel lanes and the adjacent paved shoulders. Install these signs at intervals no greater than 2600 feet.

STAGING

STAGE 1

1. INSTALL PERMANENT CONSTRUCTION SIGNING AS DIRECTED IN THE TRAFFIC CONTROL PLANS, TRAFFIC CONTROL SPECIAL PREVISIONS AND AS DIRECTED BY THE RCE.
2. PLACE PORTABLE PLASTIC DRUMS AND OTHER TRAFFIC CONTROL DEVICES AS SHOWN ON THE TRAFFIC CONTROL PLANS AND AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
3. INSTALL EROSION CONTROL DEVICES AS SHOWN IN THE EROSION CONTROL PLANS AND AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
4. INSTALL TEMPORARY BARRIER FENCE ALONG ENVIRONMENTALLY SENSITIVE AREAS AS SHOWN IN THE EROSION CONTROL PLANS AND AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
5. APPLY TEMPORARY PAVEMENT MARKINGS IN ORDER TO MAINTAIN EXISTING TRAFFIC PATTERNS IN EXISTING TRAVEL LANES WITH ALLOWABLE LANE REDUCTION WIDTHS AS SHOWN AND AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
6. CONSTRUCT CULVERT EXTENSIONS AND INSTALLATION OF TRENCHLESS PIPES.
7. REMOVE AND REPLACE US 21 EXISTING PAVED SHOULDERS AS NOTED ON THE TYPICAL SECTION AS DIRECTED BY THE REC. REPAIR/REPLACE EXISTING PAVEMENT AS NOTED ON THE TYPICAL SECTION AND SHOWN IN THE PLANS. (NOT SHOWN IN TRAFFIC CONTROL PLANS)
8. BEGIN CONSTRUCTION OF NEW BASE AND INTERMEDIATE PAVEMENT, CURB AND GUTTER, SIDEWALK, AND DRAINAGE AS INDICATED.

STAGE 2

1. MAINTAIN PERMANENT CONSTRUCTION SIGNING AS DIRECTED IN THE TRAFFIC CONTROL PLANS, TRAFFIC CONTROL SPECIAL PREVISIONS AND AS DIRECTED BY THE RCE.
2. PLACE PORTABLE PLASTIC DRUMS AND OTHER TRAFFIC CONTROL DEVICES AS SHOWN ON THE TRAFFIC CONTROL PLANS AND AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
3. MAINTAIN AND INSTALL EROSION CONTROL DEVICES AS SHOWN IN THE EROSION CONTROL PLANS AND AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
4. MAINTAIN AND INSTALL TEMPORARY BARRIER FENCE ALONG ENVIRONMENTALLY SENSITIVE AREAS WERE DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
5. APPLY TEMPORARY PAVEMENT MARKINGS IN ORDER TO MAINTAIN OR SHIFT EXISTING TRAFFIC PATTERNS WITH ALLOWABLE LANE REDUCTION WIDTHS AS SHOWN AND AS DIRECTED BY THE RCE.
6. CONTINUE CONSTRUCTION OF NEW BASE AND INTERMEDIATE PAVEMENT, CURB AND GUTTER, SIDEWALK AND DRAINAGE AS INDICATED.

THE CONTRACTOR IS ADVISED THAT THE US 21 BUSINESS CLOSURE SHOWN IN THE PLANS SHALL BE INSTALLED FOR A **SINGLE INSTANCE OF NO MORE THAN 180 DAYS**. SHOULD THE US 21 BUSINESS CLOSURE REMAIN IN PLACE OR NOT BE COMPLETELY REMOVED, **A PENALTY WILL BE ASSESSED AT A RATE OF $500.00 PER DAY**.

THE CONTRACTOR IS ADVISED THAT THE OLD SC 51 CLOSURE SHOWN IN THE PLANS SHALL BE INSTALLED FOR A **SINGLE INSTANCE OF NO MORE THAT 180 DAYS**. SHOULD THE OLD SC 51 BUSINESS CLOSURE REMAIN IN PLACE OR NOT BE COMPLETELY REMOVED, **A PENALTY WILL BE ASSESSED AT A RATE OF $500.00 PER DAY**.

STAGE 3

1. MAINTAIN PERMANENT CONSTRUCTION SIGNING AS DIRECTED IN THE TRAFFIC CONTROL PLANS, TRAFFIC CONTROL SPECIAL PREVISIONS AND AS DIRECTED BY THE RCE.
2. PLACE PORTABLE PLASTIC DRUMS AND OTHER TRAFFIC CONTROL DEVICES AS SHOWN ON THE TRAFFIC CONTROL PLANS AND AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
3. MAINTAIN AND INSTALL EROSION CONTROL DEVICES AS SHOWN IN THE EROSION CONTROL PLANS AND AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
4. MAINTAIN AND INSTALL TEMPORARY BARRIER FENCE ALONG ENVIRONMENTALLY SENSITIVE AREAS WERE DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
5. APPLY TEMPORARY PAVEMENT MARKINGS IN ORDER TO MAINTAIN OR SHIFT EXISTING TRAFFIC PATTERNS WITH ALLOWABLE LANE REDUCTION WIDTHS AS SHOWN AND AS DIRECTED BY THE RCE.
6. CONTINUE CONSTRUCTION OF NEW BASE AND INTERMEDIATE PAVEMENT, CURB AND GUTTER, SIDEWALK AND DRAINAGE AS INDICATED.

STAGE 4

1. MAINTAIN PERMANENT CONSTRUCTION SIGNING AS DIRECTED IN THE TRAFFIC CONTROL PLANS, TRAFFIC CONTROL SPECIAL PREVISIONS AND AS DIRECTED BY THE RCE.
2. PLACE PORTABLE PLASTIC DRUMS AND OTHER TRAFFIC CONTROL DEVICES AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
3. MAINTAIN AND INSTALL EROSION CONTROL DEVICES AS SHOWN IN THE EROSION CONTROL PLANS AND AS DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
4. MAINTAIN AND INSTALL TEMPORARY BARRIER FENCE ALONG ENVIRONMENTALLY SENSITIVE AREAS WERE DIRECTED BY THE RCE IN ACCORDANCE WITH SCDOT STANDARDS.
5. SHIFT TRAFFIC TO FINAL LANE CONFIGURATION AS SHOWN IN THE PAVEMENT MARKING PLANS.
6. COMPLETE CONSTRUCTION OF TEMP JUNCTION BOX, CONSTRUCT CONCRETE MEDIANS & ISLAND, PREFORM MILLING AS NOTE IN THE PLANS AND APPLY FINAL SURFACE PAVEMENT. IMPLEMENT TEMPORARY LANE CLOSURES AS NEEDED AND AS DIRECTED BY THE RCE.
7. APPLY FINAL PAVEMENT MARKINGS AS SHOWN IN THE PAVEMENT MARKING PLANS AND AS DIRECTED BY THE RCE. INSTALL SIGNING AS SHOWN IN THE SIGNING PLANS AND AS DIRECTED BY THE RCE.

General Notes (Apply to all construction stages):

1. ALL WORK AND MATERIALS SHALL CONFORM WITH THE SCDOT STANDARD SPECIFICATION FOR HIGHWAY CONSTRUCTION, SCDOT STANDARD DRAWINGS, SCDOT PROCEDURES & GUIDELINES FOR WORK AND HIGHWAYS, AND OTHER APPLICABLE SCDOT DOCUMENTS, LATEST EDITIONS.
2. APPROPRIATE CHANNELIZING DEVICES SHALL BE MAINTAINED DURING CONSTRUCTION TO SEPARATE WORK FROM TRAFFIC.
3. ALL EXISTING SIGNS IN CONFLICT WITH CONSTRUCTION SIGNING SHALL BE REMOVED, COVERED, OR RELOCATED. PROPOSED TEMPORARY PAVEMENT MARKINGS SHALL TIE TO EXISTING MARKINGS.
4. CONTRACTOR SHALL MAINTAIN SIGNAL OPERATION AT ALL SIGNALIZED INTERSECTIONS AS NOTED IN THE PLANS AND AS DIRECTED BY THE RCE.
5. CONTRACTOR SHALL INSTALL/MAINTAIN STOP BARS AND STOP SIGNS OR YIELD BAR AND YIELD SIGNS AS SHOWN IN THE PLANS AND AS DIRECTED BY THE RCE.
6. CONTRACTOR SHALL INSTALL/MAINTAIN TEMPORARY PAVEMENT MARKING ARROWS PER SCDOT STANDARD DRAWINGS AT ALL TURN LANES ONTO ROADWAYS WHERE DIRECTED BY THE RCE.
7. CONTRACTOR SHALL MAINTAIN MINIMUM TEMPORARY LANE WIDTH IN ACCORDANCE WITH SCDOT WORK ZONE TRAFFIC CONTROL UNLESS OTHERWISE APPROVED BY THE DEPARTMENT.
8. CONTRACTOR SHALL APPLY TEMPORARY 4” WHITE EDGE LINES WHEN THERE IS NO EXISTING OR NEW CURB & GUTTER PRESENT DURING TRAFFIC CONTROL AND WHERE DIRECTED BY THE RCE.
9. THE COST OF OBLITERATING EXISTING STRIPING AND MAINTAINING TRAFFIC STRIPING SHALL BE INCLUDED IN THE COST OF TRAFFIC CONTROL. CONFLICTING STRIPING BETWEEN STAGES SHALL BE ERADICATED.

10. CONTRACTOR SHALL PLACE CONSTRUCTION ZONE ELECTRIC CHANGEABLE MESSAGE SIGNS AS SHOWN IN THE PLANS, OUTLINED IN THE TRAFFIC CONTROL SPECIAL PROVISIONS AND WHERE DIRECTED BY THE RCE.
11. CONTRACTOR SHALL MAINTAIN POSITIVE SURFACE DRAINAGE DURING ALL CONSTRUCTION STAGES. CONTRACTOR SHALL APPLY BUILD-UP/LEVELING TO EXISTING ROADWAY AS PAVEMENT WIDENING OPERATION PROGRESS AS NEEDED AND AS DIRECTED BY THE RCE.
12. CONTRACTOR TO NOTIFY IN WRITING ALL BUSINESSES AND PROPERTY OWNERS OF CONSTRUCTION ACTIVITIES, DRIVEWAY MODIFICATIONS, AND OTHER ACCESS RESTRICTIONS 7 DAYS IN ADVANCE OF ANY CONSTRUCTION ACTIVITIES ADJACENT TO THEIR PROPERTY.
13. CONTRACTOR SHALL MAINTAIN ACCESS TO ALL COMMERCIAL AND PRIVATE DRIVEWAYS IN ACCORDANCE WITH THE FOLLOWING:
    A. SITE WITH TWO OR MORE DRIVEWAYS - ONE DRIVEWAY TO BE MAINTAINED CONTINUOUSLY OPENED. NO DRIVEWAY TO BE CLOSED LONGER THAN 1 DAY.
    B. SITE WITH ONE DRIVEWAY - DRIVEWAY NOT TO BE CLOSED FOR A PERIOD LONGER THAN 1 HOUR.
14. CONTRACTOR SHALL INSTALL PERMANENT CONSTRUCTION SIGNING PER SCDOT STANDARD DRAWINGS 605-010-01 AS NOTED IN THE PLANS AND/OR AS DIRECTED BY THE RCE. SIGNING SHALL BE MAINTAINED THROUGHOUT CONSTRUCTION.
15. THE CONTRACTOR SHALL BE ON SITE AT ALL TIMES TO MAINTAIN TRAFFIC CONTROL ONCE CONSTRUCTION OPERATIONS BEGIN, UNTIL COMPLETE AND APPROVED BY THE RCE.
16. PORTABLE PLASTIC DRUMS SHALL BE PLACED IN ACCORDANCE WITH SCDOT STANDARDS AND AS DIRECTED BY THE RCE. DRUM SPACING MAY BE ADJUSTED/REDUCED NOT TO CONFLICT WITH DRIVEWAY ACCESS. TYPICAL DRUM SPACING IS AS FOLLOWS UNLESS NOTED:
    A. 50 FEET SPACING FOR EXISTING POSTED SPEED 40 MPH OR LESS
    B. 100 FEET SPACING FOR EXISTING POSTED SPEED 45 MPH OR GREATER
    C. 20 FEET SPACING & NO LESS THAN 4 EA FOR RADIUS RETURN
17. CONTRACTOR SHALL INSTALL TEMPORARY CONCRETE BARRIERS PER SCDOT STANDARD DRAWINGS SECTION 605-100 THRU 605-400.
18. TEMPORARY LANE CLOSURES SHALL CONFORM TO SCDOT STANDARD DRAWINGS SECTION 610-000.
19. SHOULDER CLOSURES SHALL CONFORM TO SCDOT STANDARD DRAWINGS SECTION 610-200.
20. CONTRACTOR SHALL INSTALL ADVANCE LANE CLOSURE SIGNING PER SCDOT STANDARD DRAWINGS 610-010-00 THRU 610-040-00.
21. CONTRACTOR SHALL INSTALL EXTENDED ROAD CLOSURE SIGNING PER SCDOT STANDARD DRAWING 610-510-00 & 610-515-00
22. FOR CONSTRUCTION REQUIRING REMOVAL OF EXISTING PAVEMENT THE CONTRACTOR SHALL REMOVE AND REPLACE PAVEMENT WITHIN ONE CONTINUOUS OPERATION AS DIRECTED BY THE RCE.
23. CONTRACTOR SHALL CONSTRUCT CEMENT MODIFIED RECYCLED BASE PER SCDOT SUPPLEMENTAL TECHNICAL SPECIFICATION SC-M-306, LATEST EDITION AND/OR AS DIRECTED BY THE RCE. FOR CMRB-METHOD B THE CONTRACTOR WILL BE REQUIRED TO WAIT 2 TO 5 DAYS AFTER APPLICATION OF ASPHALT SURFACE TREATMENT (SINGLE) BEFORE THE HMA COURSE CAN BE PLACED.
24. CONTRACTOR SHALL FOLLOW LANE CLOSURE RESTRICTIONS PER SCDOT SUPPLEMENTAL SPECIFICATIONS “LANE CLOSURE RESTRICTION” LATEST EDITION, SCDOT “HOURLY RESTRICTION FOR LANE CLOSURES ON MULTILANE PRIMARY AND SECONDARY ROUTES” LATEST EDITION AND AS NOTED IN THE PROJECT TRAFFIC CONTROL SPEC. **THE CONTRACTOR IS ADVISED THAT THE LANE CLOSURE RESTRICTIONS WILL BE STRICTLY ENFORCED. SHOULD LANE CLOSURES REMAIN IN PLACE OR NOT BE COMPLETELY REMOVED BY THE TIME SPECIFIED, A PENALTY WILL BE ASSESSED AT THE RATE OF $500.00 PER HOUR.**
25. CONTRACTOR SHALL NOTIFY THE COUNTY & DEPARTMENT A MINIMUM 30 DAYS BEFORE IMPLEMENTING ANY ROADWAY CLOSURES IN ORDER TO PROVIDE AMPLE NOTIFICATION TO THE ELECTED OFFICIALS, PUBLIC AND EMERGENCY SERVICES.
26. THE CONTRACTOR MAY REVISE THE WORK ZONE TRAFFIC CONTROL WITH THE APPROVAL OF THE RCE WITH NO ADDITIONAL COST TO YORK COUNTY OR SCDOT.

Culvert Crossline Installation Notes:

1. CONTRACTOR TO USE TRENCHLESS PIPE INSTALLATION METHOD TO INSTALL NP-043, CLP-4 AND NP-812. CONTRACTOR TO INSTALL PIPES FROM LEFT TO RIGHT UNDER THE EXISTING ROADWAY PRIOR TO WIDENING AS NOTED IN STAGE 1 NOTES UNLESS APPROVED BY THE RCE. ALL OTHER PIPE CULVERT INSTALLATION SHALL BE CONSTRUCTED UTILIZING NIGHTTIME LANE CLOSURES.
2. SHOULD THE CONTRACTOR CHOOSE AN ALTERNATE MEANS OF PIPE CULVERT INSTALLATION, WITH THE APPROVAL OF THE RCE, ALL ADDITIONAL WORK AND/OR MATERIALS REQUIRED TO COMPLETE THE INSTALLATION SHALL BE AT NO ADDITIONAL COST TO YORK COUNTY OR SCDOT AND SHALL BE CONSIDERED INCIDENTAL TO THE LUMP SUM TRAFFIC CONTROL PAY ITEM.

SCDOT SUPPLEMENTAL SPECIFICATIONS REFERENCE

The following are SCDOT Supplemental Specifications and SCDOT Supplemental Technical Specifications that pertain specifically to the Widening of US 21 Bypass and SC 51. Additional Supplemental Specifications and SCDOT Supplemental Technical Specifications, not included, but which may be required for the project, are on file with the SCDOT and are available on the SCDOT website https://www.scdot.org/business/road-supplemental-specs.aspx & https://www.scdot.org/business/road-technical-specs.aspx

The list of the Supplemental Specifications provided is as follows:

Section

Critical Path Construction Schedules (March 1, 2007)
Asphalt Binder Adjustment Index (March 3, 2009)
Errata to 2007 Standard Specifications for Highway Construction (January 1, 2018)
As-Built Construction Plans (November 4, 2009)
Subsection 401.4.17, Transportation and Delivery of Mixes (July 1, 2010)
Fine Grading (January 4, 2012)
Prompt Payment Clause (July 1, 2017)
Construction Schedules (November 4, 2013)
Muck Excavation (July 1, 2017) – {**Shall be paid as Unclassified Excavation**}
627 Thermoplastic Pavement Markings (July 1, 2020)
204 Structure Excavation (January 1, 2021)
Erosion Control Measures (January 1, 2021)
Temporary Barrier Fence (July 1, 2021)
Asphalt Surface Treatment – Single Treatment (July 2, 2010)
Materials for Full Depth Patching (January 1, 2018)
Removal of Existing Asphalt Pavement before Patching (January 1, 2018)
Work Zone Traffic Control Local Law Enforcement (July 1, 2018)
Section 605 Temporary Concrete Barrier (July 1, 2020)
Work Zone Traffic Control Training Requirements for Contractors/Subcontractors (July 1, 2020)

SC-M-210 Flowable Fill (June 2011)
SC-M-400 Asphalt Mixture Quality Acceptance (February 2020)
SC-M-675 Traffic Signals (January 2023)
SC-M-805-1 Guardrail (January 2023)
SC-M-810-4 Seeding (January 2021)
SC-M-815-2 Silt Fence Systems (July 2018)
SC-M-815-8 Inlet Structure Filters (July 2017)
SC-M-815-9 Rolled Erosion Control Product {RECP} (July 2017)
SC-M-815-10 Stabilized Construction Entrance (July 2018)
SC-M-815-11 Hydraulic Erosion Control Products (April 2011)

SECTION 809: RIGHT OF WAY PLAT:

Description:

The contractor by the "Substantial Work Complete" date shall prepare a right of way plat signed and sealed by a Professional Land Surveyor (PLS) licensed to practice in the state of South Carolina. The right of way plat shall be in accordance with the requirements of Section 49-460-A "General Property Survey" as outlined in the South Carolina "Standards of Practice Manual" for land surveyors. A copy of the plat will be recorded, by the contractor, in the Register Mesne Conveyance (RMC) office of the county or counties in which the project resides. The contractor will provide one copy of the plat on a full sized plan sheet(s) (22" X 36") and submit to the resident construction engineer to be included in the as-built plans. In addition, the contractor shall furnish one PDF copy of the plat sheet(s) and one copy of the cad file(s) of the plat to York County.

Materials: Rebar Cap R/W Marker

Materials used shall comply with those listed on SCDOT Standard Drawing Nos. 809-105-00 or 809-110-00.

Construction Requirements:

The PLS shall set right of way markers along all new right of way lines as well as along any present right of way being retained by the Department at intervals listed on the SCDOT Standard Drawings. Right of way markers shall not be placed at points common to side property lines and/or corners. In the event that the plan reflects a break in the right of way along a side property line the right of way marker will not be set without the side property line being retraced and established by way of survey. The PLS shall prepare a plat documenting the location of all Right of Way Markers set and reflecting the as-built station and offset from the plan alignment. The plat shall show the entire project corridor as an enclosed strip or parcel of land to include the mainline and all side roads as defined on the project plan.

Measurement and Basis of Payment:

The item Right of Way Plat is paid on a lump sum (LS) basis; and therefore, there is no specific measurement for this item. The unit price bid for Property Right of Way Plat shall include all costs for labor, materials, equipment, services of a PLS and any related fees or costs associated with producing a plat, recording the plat at the RMC office, and all required copies. Each marker placed in accordance with the Standard Drawings complete and accepted will be measured and paid at the unit price bid.

Item No.	Description	Unit
8091010	RIGHT OF WAY MARKER (REBAR AND CAP)	EA
8091000	RIGHT OF WAY MARKER (REINFORCED CONCRETE)	EA
8091050	RIGHT OF WAY PLAT	LS

PROJECT ID: 0042332 **COUNTY** YORK

1. **LIST OF TRAFFIC SIGNALS WITHIN PROJECT**

#	Intersection Name	Description of Signal Work
1	US 21 BYPASS AT SC 460	REVISION
2	US 21/US 21 BYPASS AT S-1726/US 21 BUSINESS	NEW CONSTRUCTION (REALIGNED)
3	US 21 AT CENTRAL CAROLINAS PKWY/SHOPPING CENTER	REBUILD
4	US 21 AT REGENT PARKWAY	REBUILD
5	US 21 AT S-641/RETAIL DRIVE	REBUILD
6	US 21 AT SC 51	NEW CONSTRUCTION (REALIGNED)
7	SC 51 AT S-641/S-48	NEW CONSTRUCTION (REALIGNED)

2. **PROJECT DESCRIPTION**

This Project is a ROAD WIDENING **construction project and involves the signal construction of** SEVEN (7) **intersections along** US 21 **in and around** FORT MILL **South Carolina. The intersections involved are shown on the above "List of Traffic Signals within Project or listed on the plans.**

Specific Description of the signal work: Rebuild, New Construction, Temporary Adjustments, Partial work, Communications.

3. **PAY ITEM ADDITIONAL INFORMATION** (if no changes, this can be eliminated)

Below is more information concerning any changes, revisions, or clarifications to the SCDOT Traffic Signal Supplemental Specifications and/or pay items for this particular contract:

Mobilization:

Wiring:

Communications:

Fiber optic cable for interconnect between intersection #2 to intersection #6. Existing fiber from I-77 to intersection #3.

Detection:

Radar detection at all interseections except intersection #1 which will have loops sawcut in pavement. The radar detection will consist of stopbar detection, setback detection and/or speed/volume detection.

Signal Supports:

Steel Strain Poles

Signal Heads, Pedestrian Treatments, Illuminated signs, solar flashing assemblies:

Cabinet Items:

All controller cabinets include an extender base and battery backup.

Service Items:

4. **EQUIPMENT (***Only needed if SCDOT is providing equipment to be installed by contractor.)*

6.1 SCDOT Provided Equipment *(Provide a list of equipment, location of equipment, details concerning equipment & installation)*

6.2 Faulty Equipment

- When SCDOT supplied equipment is designated faulty by the Engineer, the Contractor shall return it to the Manufacturer for replacement if it is under warranty, The Manufacturer shall furnish a replacement unit.
- When SCDOT supplied equipment is designated faulty by the Engineer and it is not under warranty, SCDOT shall replace the equipment.

5. **SIGNAL INTEGRATION** *(Only needed if different than the default. The default wording in the Supplemental Specifications (675.0 General Provisions 1.10) indicates SCDOT or local government signal maintenance staff will perform integration. If different than that, list what entity will perform integration.)*

- The _____ will perform integration in accordance with the Supplemental Specifications, 675.0 General Provisions.

6. **MAINTENANCE DURING CONSTRUCTION –** (*Only needed if different than the default. The default wording in the Supplemental Specifications (675.0 General Provisions 1.5) indicates that this begins at the contract NTP (notice to proceed) for all signals in the contract. If different than that, list whether maintenance begins at:*
   a. *When a work order is assigned by construction office*
   b. *When the contractor begins work at a signal*
   c. *Other option*

7. **CONTRACT SCHEDULE –** (*Only needed if different than the default.* The default wording in the *Supplemental Specifications indicates that contractor will to provide weekly schedule for all signal work. If SCDOT determines a need to set the schedule, indicate such below:)*

Example wording:

This is a "TURN-KEY" project where work is assigned using a work order system. Once work orders have been assigned to the ***CONTRACTOR, he*** *shall furnish the Engineer with a* ***WEEKLY SCHEDULE*** *for all active traffic signal construction work orders, each Friday, for the week to come, listing the location and date of each intended activity. This will permit scheduling signal inspection personnel. Deviation from this schedule may cause the Department to delay Inspection and Payments.*

INSTALLATION OF TRAFFIC SIGNALS

In order to provide uniformity in the manner in which signals are installed and placed in operation, all District Electrical Personnel should use the following procedure for the installation or replacement of new traffic signals.

1. Install poles, guys, overhead cable including signal head connections, but do not install signal heads until ready to place in flashing mode.

2. Install controller cabinet, cut loops and complete incidental work necessary to place signal in flashing mode.

3. Install heads and "bag" if necessary until the head can be placed in flashing mode and flash for at least 3 and not more than 7 days. Bag signal heads only in the event where all of the heads can not be installed within the same work day or if the intersection is a replacement of a closed loop system where the entire system is to be placed in operation at one time and the existing system will remain in operation until the switch over is initiated. **In the event where signalized intersections are replaced with new equipment, there is no mandatory flash period required.**

4. On the day the signal is to be placed in stop and go operation, erect "Signal Ahead" signs (**MUTCD** W3-3) on all approaches with a "NEW" plaque above the signs. When the signal is placed into operation, remove the "Stop" signs from the side street and "Stop Ahead" signs if applicable. Supplement the "Signal Ahead" signs with portable flashers and/or orange flags to draw attention to the signs.

5. The signal should be placed into operation on a normal workday, after the morning peak hour and prior to the afternoon peak hour.

6. The flags or flashers and the "NEW" plaques should be removed approximately two months after the signal is placed in operation.

SCDOT TRAFFIC SIGNAL SPECIAL PROVISIONS – TRAFFIC CONTROL
FOR TRAFFIC SIGNAL PROJECTS

MAINTENANCE OF TRAFFIC

TRAFFIC CONTROL:

The Contractor shall execute the item of Traffic Control as required by the Standard Specifications, the plans, the Standard Drawings For Road Construction, these special provisions, all supplemental specifications, the MUTCD, and the Engineer. This is an amendment to the Standard Specifications to require the following:

GENERAL REGULATIONS -

These special provisions shall have priority to the plans and comply with the requirements of the MUTCD and the standard specifications. Revisions to the traffic control plan through modifications of the special provisions and the plans shall require approval by the department. **Final approval of any revisions to the traffic control plan shall be pending upon review by the Director of Traffic Engineering.**

Install and utilize changeable message signs in all lane closures installed on high volume high-speed multilane roadways. Use of changeable message signs in lane closures installed on low volume low speed multilane roadways is optional unless otherwise directed by the plans and the Engineer. Install and use a changeable message sign within a lane closure set-up as directed by the *Standard Drawings For Road Construction*. When a lane closures is not present for any time to exceed 24 hours, remove the changeable message sign from the roadway. Place the sign in a predetermined area on the project site, as approved by the Engineer, where the sign is not visible to passing motorists. The preprogrammed messages utilized shall be in accordance with the *Standard Drawings For Road Construction* when used as part of the traffic control set-up for lane closures. Only those messages pertinent to the requirements of the traffic control situation and the traffic conditions are permitted for display on a changeable message sign at all times. At no time will the messages displayed on a changeable message sign duplicate the legends on the permanent construction signs.

During operation of changeable message signs, place the changeable message sign on the shoulder of the roadway no closer than 6 feet between the sign and the near edge of the adjacent travel lane. When the sign location is within 30' of the near edge of a travel lane open to traffic, supplement the sign location with no less than 5 portable plastic drums placed between the sign and the adjacent travel lane for delineation of the sign location. Install and maintain the drums no closer than 3 feet from the near edge of the adjacent travel lane. This requirement for delineation of the sign location shall apply during all times the sign location is within 30' of the near edge of a travel lane open to traffic, including times of operation and non-operation. Oversized cones are prohibited as a substitute for the portable plastic drums during this application.

All signs mounted on portable sign supports shall have a minimum mounting height of 5' from the bottom of the sign to the ground. All signs mounted on ground mounted u-channel posts or square steel tube posts shall have a minimum mounting height of 7' from the bottom of the sign to the grade elevation of the near edge of the adjacent travel lane or sidewalk when a sidewalk is present.

On multilane primary routes, avoid placement of signs mounted on portable sign supports within paved median areas utilized for two-way left turns unless otherwise directed by the RCE.

When mounting signs on multiple ground mounted sign supports, ensure that each post is of the same type. Combining and installing both ground mounted u-section and square steel tube posts within the same sign assembly is prohibited.

When mounting signs on ground mounted u-section or square steel tube posts, utilize either a sign support / ground support post combination with an approved breakaway assembly or a single direct driven post for each individual sign support of a sign assembly installation. Do not combine a sign support / ground support post combination and a direct driven post on the same sign assembly installation that contains two or more sign supports. Regarding sign support / ground support post combination installations, ensure that post lengths, stub heights and breakaway assemblies comply

with the manufacturer's requirements and specifications. Use approved breakaway assemblies found on the *Approved Products List For Traffic Control Devices in Work Zones*.

Temporary "Exit" signs (M1025-00) shall be located within each temporary gore during lane closures on multilane roadways. Mount these signs a minimum of 7' from the pavement surface to the bottom of the sign in accordance with the requirements of the MUTCD.

When covering signs with opaque materials, the Department prohibits attaching a covering material to the face of the sign with tape or a similar product or any method that will leave a residue on the retroreflective sheeting. Residue from tape or similar products, as well as many methods utilized to remove such residue, damages the effective reflectivity of the sign. Therefore, contact of tape or a similar product with the retroreflective sheeting will require replacement of the sign. Cost for replacement of a sign damaged by improper covering methods will be considered incidental to providing and maintaining the sign; no additional payment will be made.

Overlays are prohibited on all rigid construction signs. The legends and borders on all rigid construction signs shall be either reversed screened or direct applied.

Signs not illustrated on the typical traffic control standard drawings designated for permanent construction signs shall be considered temporary and shall be included in the lump sum price bid item for "Traffic Control" unless otherwise specified.

Install "Grooved Pavement" signs (W8-15-48) supplemented with the "Motorcycle" plaque (W8-15P-30) in advance of milled or surface planed pavement surfaces. Install these signs no further than 500 feet in advance of the beginning of this pavement condition on primary routes with speed limits of 60 MPH or less and no less than 500 feet in advance of the beginning of this pavement condition on interstate routes. On multilane roadways, comply with the same guidelines as applied to all other advance warning signs and install two sign assemblies at each sign location, one on each side of the roadway, when roadway conditions warrant. Install these signs immediately upon creation of this pavement condition and maintain these signs until this pavement condition is eliminated.

Install "Steel Plate Ahead" signs (W8-24-48) in advance of an area of roadway where temporary steel plates are present. Install these signs no further than 300 feet in advance of locations where steel plates are present. On multilane roadways, comply with the same guidelines as applied to all other advance warning signs and install two sign assemblies at each sign location, one on each side of the roadway, when roadway conditions warrant. Install these signs immediately upon installation of a temporary steel plate and maintain the signs until the temporary steel plates are removed.

The Contractor shall maintain the travel patterns as directed by the traffic control plans and shall execute construction schedules expeditiously. The Contractor shall provide the Resident Engineer with no less than a two-week prior notification of changes in traffic patterns.

During nighttime flagging operations, flaggers shall wear a safety vest and safety pants that comply with the requirements of ANSI / ISEA 107 standard performance for Class 3 risk exposure, latest revision, and a fluorescent hard hat. The safety vest and the safety pants shall be retroreflectorized and the color of the background material of the safety vest and safety pants shall be fluorescent orange-red or fluorescent yellow-green.

During nighttime flagging operations, the contractor shall illuminate each flagger station with any combination of portable lights, standard electric lights, existing street lights, etc., that will provide a minimum illumination level of 108 Lx or 10 fc.

During nighttime flagging operations, supplement the array of advance warning signs with a changeable message sign for each approach. These changeable message signs are not required during daytime flagging operations. Install the changeable message signs 500' in advance of the advance warning sign arrays. Messages should be "Flagger Ahead" and "Prepare To Stop".

TRAFFIC CONTROL PROCEDURES SPECIFIC TO TRAFFIC SIGNAL WORK OPERATIONS –

Utilize a vehicle train consisting of a primary work vehicle and no less than 1 shadow vehicle. The shadow vehicle is required for all Traffic Signal Work Operations except on a two-lane roadway for a time duration of 15 minutes or less when no pedestrian workers are present, excluding the flagger. A second

shadow vehicle is necessary in some applications on multilane roadways as depicted on the Standard Drawings. Install and maintain the vehicle train as directed by these special provisions, , the Standard Drawings For Road Construction, and the Engineer.

Two-Lane Two-Way Roadways

A. Utilize flagging operations to control the traffic flow around the work site where the vehicle train is operating.

B. Utilize flaggers to control the traffic flow on an intersecting two-lane two-way roadway. The advance warning signs for the flagging operations shall include the following:

W20-7a-48	Flagger symbol
W20-4-48-A	One Lane Road Ahead
W20-1-48-A	Road Work Ahead

C. Maintain two-way radio communications between all flaggers.

Multilane Roadways

A. During work operations that require the vehicle train to encroach upon or operate within the limits of a travel lane for a time duration of 15 minutes or less, advance warning signs may be omitted.

B. During work operations that require the vehicle train to encroach upon or operate within the limits of a travel lane for a time duration in excess of 15 minutes but less than 60 minutes, advance warning signs are required. Typical advance warning signs required for a temporary closure of a travel lane shall include the following:

W4-2R(L)-48	Lane Ends symbol
W20-5R(L)-48-A	Right (Left) Lane Closed Ahead
W20-1-48-A	Road Work Ahead

C. Utilization of flaggers to control the traffic flow in the travel lanes adjacent to the travel lane the vehicle train is operating in is PROHIBITED except as allowed in the Standard Drawings Requirements for a Temporary Cessation of Traffic Flow for a time duration of 3 minutes or less.

D. Utilize flaggers to control the traffic flow on an intersecting two-lane two-way roadway. Only flaggers and advance warning signs are required on the approaches intersecting the travel lane the vehicle train is operating in. Traffic control devices are not required on the intersecting approaches. The advance warning signs for the flagging operations shall include the following:

W20-7a-48	Flagger symbol
W20-4-48-A	One Lane Road Ahead
W20-1-48-A	Road Work Ahead

E. **During work operations that require the vehicle train to encroach upon or operate within the limits of a travel lane for a time duration in excess of 60 minutes, install a standard lane closure as directed by these special provisions, the Standard Drawings For Road Construction, and the Engineer.**

Conduct all equipment and material preparations prior to entering the roadway.

Conducting traffic signal work or conducting any activities that interfere with or create disruptions to normal traffic operations during morning, mid-day, and afternoon-evening high traffic volume peak periods is PROHIBITED. The contractor shall observe all lane closure restrictions.

Conduct all work activities within the boundaries of a travel lane closed to vehicular traffic or a pedestrian thoroughfare closed to pedestrian traffic. Conducting work activities over a travel lane open to traffic is PROHIBITED. Conducting work activities over a pedestrian thoroughfare open to pedestrian traffic is PROHIBITED. Do not conduct any work activities in any manner over a thoroughfare open to vehicular or pedestrian traffic.

When advance warning signs are required to supplement the vehicle train, install the advance warning signs at spacing intervals based on the regulatory speed limit of the roadway prior to beginning any work. When a work zone traffic control plan or a work zone traffic control standard drawing is not provided to indicate the spacing intervals for a typical 3 advance warning sign array installation, utilize the sign placement intervals below. **These sign intervals do not apply to the sign intervals of the advance sign intervals for standard lane closures.**

ADVANCE WARNING SIGN PLACEMENT INTERVALS	
URBAN / RURAL (LOW SPEED) ≤ 35 MPH	200 / 200 / 200 Feet
URBAN / RURAL (INTERMEDIATE SPEED) 40 - 50 MPH	350 / 350 / 350 Feet
RURAL (HIGH SPEED) ≥ 55 MPH	500 / 500 / 500 Feet
INTERSTATE	1000 / 1500 / 2600 Feet

LANE CLOSURE RESTRICTIONS –

The lane closure restrictions stated below are project specific, for all other restrictions, see supplemental specification, "Restrictions", dated September 1, 2015.

The Contractor shall install all lane closures as directed by the Standard Specifications For Highway Construction (latest edition), the Standard Drawings For Road Construction, these special provisions, the MUTCD, and the Engineer. The Contractor shall close the travel lanes of two-lane two-way roadways by installing flagging operations. The Contractor shall close the travel lanes of multilane roadways as directed by the typical traffic control standard drawings designated for lane closures on primary routes.

The Department prohibits lane closures on primary and secondary routes during any time of the day that traffic volumes in the travel lanes remaining open to traffic exceed 800 vehicles per hour per lane per direction. The Department reserves the right to suspend a lane closure if any resulting traffic backups are deemed excessive by the Engineer. Maintain all lane closure restrictions as directed by the plans, these special provisions, and the Engineer.

Flagging operations are considered to be lane closures for two-lane two-way operations and shall be subject to all restrictions for lane closures as specified by this contract.

Lane closures, including flagging operations, are restricted to maximum distances of 2 miles. Install all lane closures according to the typical traffic control standard drawings. On occasions when daytime lane closures must be extended into the nighttime hours, substitute the nighttime lane closure standards for the daytime lane closure standards.

The Department reserves the right to suspend a lane closure if any resulting traffic backups are deemed excessive by the Engineer. Maintain all lane closure restrictions as directed by the Standard Specifications, these special provisions, and the Engineer.

Installation and maintenance of a lane closure is PROHIBITED when the Contractor is not actively engaged in work activities specific to the location of the lane closure unless otherwise specified and approved by the Engineer. The length of the lane closure shall not exceed the length of roadway anticipated to be subjected to the proposed work activities within the work shift time frame or the maximum lane closure length specified unless otherwise approved by the Engineer. Also, the maximum lane closure length specified does not warrant installation of the specified lane closure length when the length of the lane closure necessary for conducting the work activity is less. The length and duration of each lane closure, within the specified parameters, shall require approval by the Engineer prior to installation. The length and duration of each lane closure may be reduced by the Engineer if the work zone impacts generated by a lane closure are deemed excessive or unnecessary.

The presence of temporary signs, portable sign supports, traffic control devices, trailer mounted equipment, truck mounted equipment, vehicles and vehicles with trailers relative to the installation or removal of a closure and personnel are prohibited within the 15 to 30 foot clear zone based upon the roadway speed limit during the prohibitive hours for lane closures specified by these special provisions.

The truck mounted changeable message signs are in addition to the requirements for trailer mounted changeable message signs. Truck mounted changeable message signs and trailer mounted changeable message signs are not interchangeable.

SHOULDER CLOSURE RESTRICTIONS -

The Department prohibits the Contractor from conducting work within 15' of the near edge of the adjacent travel lane on the outside shoulders or the median areas under a shoulder closure during any time that traffic volumes exceed 800 vehicles per hour per direction. The hourly restrictions for lane closures shall also apply to work activities conducted under a shoulder closure within 15' of the near edge of an adjacent travel lane or a median area. The Department reserves the right to suspend work conducted under a shoulder closure if any traffic backups develop and are deemed excessive by the Engineer. Maintain all shoulder closure restrictions as directed by the plans, these special provisions, and the Engineer.

On primary and secondary roadways, the Department prohibits the Contractor from conducting work within 1' or less of the near edge of an adjacent travel lane under a shoulder closure. All work that may require the presence of personnel, tools, equipment, materials, vehicles, etc., within 1' of the near edge of an adjacent travel lane shall be conducted under a lane closure.

The Contractor shall install all shoulder closures as directed by the typical traffic control standard drawings designated for shoulder closures, and the Engineer. Substitution of the portable plastic drums with oversized cones during nighttime shoulder closures is PROHIBITED.

TYPICAL TRAFFIC CONTROL STANDARD DRAWINGS -

The typical traffic control standard drawings of the "Standard Drawings For Road Construction", although compliant with the MUTCD, shall take precedence over the MUTCD. The typical traffic control standard drawings of the "Standard Drawings For Road Construction" shall apply to all projects let to contract.

ADDENDUMS

(Addendums to the "2007 Standard Specifications for Highway Construction")

(A) Construction (Sub-section 601.4) –

Sub-section 601.4.2 Construction Vehicles (paragraph 2) -

When working within the rights-of-way of access-controlled roadways such as Interstate highways, the Contractor's vehicles may only change direction of travel at interchanges. These vehicles are prohibited from crossing the roadway from right side to the median or vice versa. Use a flagger to control the Contractor's vehicles when these vehicles attempt to enter the roadway from a closed lane or the median area. Ensure the flagger does not stop roadway traffic, cause roadway traffic to change lanes, or affect roadway traffic in any manner. The Contractor's vehicles may not disrupt the normal flow of roadway traffic or enter the travel lane of the roadway until a sufficient gap is present.

The Contractor shall have flaggers available to control all construction vehicles entering or crossing the travel lanes of secondary and primary routes. The RCE shall determine the necessity of these flaggers for control of these construction vehicles. The RCE shall consider sight distance, vertical and horizontal curves of the roadway, prevailing speeds of roadway traffic, frequency of construction vehicles entering or crossing the roadway and other site conditions that may impact the safety of the workers and motorists when determining the necessity of these flaggers. Ensure these flaggers do not stop roadway traffic, cause roadway traffic to change lanes or affect roadway traffic in any manner. The Contractor's vehicles may not disrupt the normal flow of roadway traffic or enter the travel lane of the roadway until a sufficient gap is present.

When working within the rights-of-way of access-controlled roadways with posted regulatory speed limits of 55 MPH or greater and average daily traffic volumes {ADT} of 10,000 vehicles per day or greater, all construction and work vehicles possessing any one or more of the vehicular characteristics listed below are only permitted to enter and exit a right or left shoulder work area during the presence of active lane closures unless otherwise directed by the RCE. These vehicles are not permitted to enter or exit these work areas without the presence of active lane closures unless otherwise directed by the RCE. Shoulder closures are unacceptable and insufficient methods for control of traffic at ingress / egress areas for these vehicles. The restrictive vehicular characteristics include the following:

- Over six (6) tires
- Tandem rear axles
- A base curb weight greater than 8000 lbs.
- A gross vehicular weight greater than 12000 lbs. unless performing duties as a shadow vehicle while supporting a truck mounted attenuator
- A trailer in tow except under the following conditions:
  - Trailers transporting traffic control devices (including but not limited to standard and 42" oversized traffic cones, portable plastic drums, signs, portable sign supports, u-channel and square steel tube sign posts) relative to the installation of lane closures, shoulder closures or other traffic control operations approved by the RCE
  - Trailer mounted traffic control devices (including but not limited to advance warning arrow panels, changeable message signs, temporary traffic signals, highway advisory radios, work zone intelligent transportation systems and trailer towed truck mounted attenuators)

(B) Construction (Sub-section 601.4) –

Sub-section 601.4.2 Construction Vehicles -

Auxiliary Warning Lights for Vehicles and Equipment -

Supplement all construction and/or construction-related vehicles and equipment that operate in a stationary or mobile work zone within or adjacent to a roadway within the highway rights-of-way with AMBER or YELLOW colored high intensity rotating or strobe type flashing auxiliary warning light devices. Utilize, install, operate and maintain a single or multiple lighting devices as necessary to provide visibility to approaching motorists.

All auxiliary warning light models shall meet *Society of Automotive Engineers* (SAE) Class I standards and SAE Standard J575 relative to *Tests for Motor Vehicle Lighting Devices and Components* and these specifications.

The amber/yellow color of the dome/lens of an auxiliary warning light device shall meet SAE Standard J578 for amber/yellow color specifications.

Auxiliary warning lights with parabolic reflectors that rotate shall rotate around a halogen lamp at a rate to produce approximately 175 flashes per minute. The parabolic reflector shall produce a minimum 80,000 candle power and a minimum 54,000 candela through an SAE Standard J846 approved amber dome.

Equip strobe type flashing auxiliary warning light devices with photosensitive circuit controls to adjust the lighting intensity in response to changes in ambient light conditions such as from day to night. These lights shall have a double-flash capability rated at approximately 80 double flashes per minute and produce a minimum 24 joules of flash energy at the highest power level setting.

Acceptable auxiliary warning light models shall provide sufficient light output to be clearly recognizable at a minimum distance of 1750 feet.

Mount all auxiliary warning light devices intended to function as the auxiliary warning light system or as an element thereof on vehicles and equipment at locations no less than 3 feet above the ground and in conspicuous locations to provide visibility to approaching motorists.

Auxiliary warning light devices and/or models that mount in the locations of the standard vehicle lighting system are unacceptable as the specified auxiliary warning light system due to restrictive simultaneous visibility capabilities from multiple sight angles. However, auxiliary warning light devices that mount in the standard vehicle lighting system locations are acceptable as supplements to the specified lighting devices mounted in locations that do meet the minimum height requirements and provide simultaneous visibility capabilities from multiple sight angles.

Standard vehicle hazard warning lights are only permitted as supplements to the specified auxiliary warning light devices.

(C) General Requirements for Providing and Maintaining Traffic Control Devices in the Work Zone (Section 602) –

Sub-section 602.4 Construction (paragraph 8) -

Mount flat sheet signs straight and level and with the face of the signs perpendicular to the surface of the roadway. This requirement applies to flat sheet signs whether they are portable or have the embedded supports. Mount advance construction signs 2 feet from the edge of a paved shoulder or the

face of a curb, or if no paved shoulder exists, 6 feet to 12 feet from the edge of an adjacent travel lane to the nearest edge of the signs. The mounting height of single signs mounted on ground embedded sign supports is no less than 7 feet or no greater than 8 feet from the bottom edge of the sign to the grade elevation of the near edge of the adjacent travel lane or sidewalk when a sidewalk is present. Any secondary sign on the same assembly has a minimum mounting height of 6 feet from the ground to the bottom edge of the secondary sign. Ensure that signs mounted on portable sign supports, including advance construction signs, regulatory signs, warning signs, etc., have a minimum mounting height of 5 feet from the ground to the bottom edge of the sign. Provide special sign mounting assemblies, when necessary, in areas of double-layered guardrail, concrete median barrier, or bridge parapet walls.

(D) Category I Traffic Control Devices (Section 603) –

Sub-section 603.2.2 Oversized Traffic Cones (paragraph 6) -

Reflectorize each oversized traffic cone with 4 retroreflective bands: 2 orange and 2 white retroreflective bands. Alternate the orange and white retroreflective bands, with the top band always being orange. Make each retroreflective band not less than 6 inches wide. Utilize Type III – Microprismatic retroreflective sheeting for retroreflectorization on all projects let to contract after May 1, 2010 unless otherwise specified. Separate each retroreflective band with not more than a 2-inch non-reflectorized area. Do not splice the retroreflective sheeting to create the 6-inch retroreflective bands. Apply the retroreflective sheeting directly to the cone surface. Do not apply the retroreflective sheeting over a pre-existing layer of retroreflective sheeting.

Sub-section 603.2.3 Portable Plastic Drums (paragraph 3) -

Reflectorize each drum with Type III – Microprismatic retroreflective sheeting: 2 orange and 2 white retroreflective bands, 6 inches wide on all projects let to contract after May 1, 2010 unless otherwise specified. Alternate the orange and white retroreflective bands with the top band always being orange. Ensure that any non-reflectorized area between the orange and white retroreflective bands does not exceed 2 inches. Do not splice the retroreflective sheeting to create the 6-inch retroreflective bands. Apply the retroreflective sheeting directly to the drum surface. Do not apply the retroreflective sheeting over a pre-existing layer of retroreflective sheeting.

(E) Category II Traffic Control Devices (Section 604) –

Sub-section 604.2.1 Type I and Type II Barricades (paragraph 3) -

Reflectorize these barricades with Type VIII or IX Prismatic retroreflective sheeting on all projects let to contract after May 1, 2012 unless otherwise specified. Ensure that the retroreflective sheeting has alternate orange and white stripes sloping downward at a 45-degree angle in the direction of passing traffic. The stripes shall be 6 inches wide.

Sub-section 604.2.2 Type III Barricades (paragraph 3) -

Reflectorize these barricades with Type VIII or IX Prismatic retroreflective sheeting on all projects let to contract after May 1, 2012 unless otherwise specified. Ensure that the retroreflective sheeting has alternate orange and white stripes sloping downward at a 45-degree angle. Apply the sloping orange and white stripes in accordance with the requirements of the Plans, SCDOT Standard Drawings and the MUTCD. The stripes shall be 6 inches wide.

(F) **Temporary Concrete Barrier** (Sub-section 605.2.3.2) –

Sub-section 605.2.3.2 Temporary Concrete Barrier (paragraph 6) -

Previously used temporary concrete barrier walls are subject to inspection and approval by the RCE before use. Ensure that previously used temporary concrete barrier walls are in good condition. Defects to a temporary concrete barrier wall that may disqualify a section of wall for use include gouges, cracks, chipped, or spalled areas. A defect that exposes reinforcing steel warrants immediate disqualification. A disqualification grade type defect shall consist of measurements in excess of 1 inch, entirely or partially within the boundaries of the end connection areas and the drainage slot areas as illustrated in the "Standard Drawings for Road Construction", and/or in excess of 4 inches for all areas beyond the end connection areas. To warrant disqualification, these measurements shall exceed the specified dimensions in all three directions, width, height, and depth. A defect that exceeds the specified dimensions in only one or two of the three directions does not warrant disqualification.

Temporary concrete barrier walls with defects less than 6 inches in all three directions, width, height, and depth that do not expose reinforcing steel may be repaired in accordance with the following requirements. Repair is prohibited on temporary concrete barrier walls with defects 6 inches or greater in all three directions, width, height, and depth.

For repair of temporary concrete barrier walls with defects less than 6 inches in all three directions, width, height, and depth that do not expose reinforcing steel, repair the defect with a premanufactured patching material specifically fabricated for patching structural concrete. The strength of the patch must meet or exceed the design strength of the class 3000 concrete of the temporary concrete barrier wall. Perform the repair procedures in accordance with all requirements and instructions from the manufacturer of the patch material. Use a bonding compound between the patch material and the concrete unless specifically stated by the manufacturer that a bonding compound is not required. If the manufacturer states that application of a bonding compound is optional, SCDOT requires application of a bonding compound compatible with the patch material. If cracking occurs within the patched area, remove the patch material completely and repeat the repair process. The contractor shall submit documentation stating all repairs have been conducted in accordance with these requirements prior to installing any temporary concrete barrier walls with repairs. Utilization of temporary concrete barrier walls with repairs shall require approval by the RCE prior to installation.

The Contractor shall submit certification documents for the patch material utilized for repairs to the Engineer prior to placing temporary concrete barrier walls that have been repaired on the project site.

Sub-section 605.2.3.2 Temporary Concrete Barrier (paragraph 5) -

In regard to projects let to contract after January 1, 2017, ALL NCHRP Report 350 compliant temporary concrete barrier walls placed on a project site SHALL comply with the requirements for the recessed approval stamp as directed by the SCDOT Standard Drawings. Those NCHRP Report 350 compliant temporary concrete barrier walls with the original recessed approval stamp that reads "SCDOT 350" will continue to be acceptable on projects let to contract after January 1, 2017. However, those temporary concrete barriers with the "SCDOT 350" identification plate attached to the side of the barrier walls with mechanical anchors previously grandfathered will no longer be acceptable on projects let to contract after January 1, 2017.

(G) Construction Signs (Sub-section 605.4.1.1) –

On all projects relative to **interstate highways** let to contract after January 1, 2016, all signs attached to portable sign supports on and/or adjacent to **interstate highways** shall be rigid. Fabricate each of these rigid signs from an approved aluminum laminate composite rigid sign substrate approved by the Department. Utilization of signs fabricated from roll-up fabric substrates attached to portable sign supports installed on and/or adjacent to **interstate highways** will no longer be acceptable on projects let to contract after January 1, 2016.

ONLY those portable sign supports specified and approved for support of rigid signs fabricated from approved aluminum laminated composite rigid sign substrates and included on the Approved Products List for Traffic Control Devices in Work Zones, latest edition, are acceptable. To facilitate location of acceptable portable sign supports, the listing of portable sign supports is now separated into two (2) sections; "Portable

Sign Supports for Use with Roll-Up Signs ONLY" and "Portable Sign Supports for Use with Roll-Up Sign Substrates and Rigid Sign Substrates".

The trade names of the approved aluminum laminate composite rigid sign substrates are "Acopan", "Alpolic", "Dibond" and "Reynolite". These rigid sign substrates are restricted to thicknesses no greater than 2 millimeters.

Rigid signs fabricated from standard aluminum sign blanks or any other rigid material other than Acopan, Alpolic, Dibond or Reynolite are PROHIBITED for attachment to portable sign supports. However, rigid signs fabricated from standard 0.080 and 0.100 inches thick aluminum sign blanks will continue to be acceptable for mounting on ground mounted sign supports.

Signs fabricated from roll-up fabric substrates approved by the Department will continue to be acceptable for use on and/or adjacent to secondary and primary roadways unless otherwise directed by the Department.

The minimum mounting height of signs mounted on these portable sign supports shall continue to be 5 feet from the ground to the bottom edge of the sign except where a minimum 7 foot mounting height is required in accordance with the standard specifications, the standard drawings, these special provisions and the MUTCD, latest edition.

(H) Truck-Mounted Attenuator (Sub-section 605.4.2.2) –

Sub-section 605.2.2.2.3.3 Color (paragraph 1) -

Use industrial grade enamel paint for cover of the metal aspects of the unit. Provide and attach supplemental striping to the rear face of the unit with a minimum Type III high intensity retroreflective sheeting unless otherwise directed by the Department. Utilize an alternating 4 to 8 inch black and 4 to 8 inch yellow 45-degree striping pattern that forms an inverted "V" at the center of the unit that slopes down and to the sides of the unit in both directions from the center.

(I) Truck-Mounted Attenuator (Sub-section 605.4.2.2) –

Sub-section 605.4.2.2 Truck-Mounted Attenuators (paragraph 6) -

A direct truck mounted truck mounted attenuator is mounted and attached to brackets or similar devices connected to the frame of a truck with a minimum gross vehicular weight (GVW) of 15,000 pounds (actual weight) unless otherwise directed. A trailer towed truck mounted attenuator is towed from behind and attached via a standard pintle hook / hitch to the frame of a truck with a minimum gross vehicular weight (GVW) of 10,000 pounds (actual weight) unless otherwise directed.

Each truck utilized with a truck mounted attenuator shall comply with the manufacturer's requirements to ensure proper operation of the attenuator. The minimum gross vehicular weight (GVW) (actual weight) for each truck shall comply with these specifications unless otherwise directed within the "Remarks" column of the *Approved Products List For Traffic Control Devices in Work Zones* in regard to specific requirements for the device in question.

If the addition of supplemental weight to the vehicle as ballast is necessary, contain the material within a structure constructed of steel. Construct this steel structure to have a minimum of four sides and a bottom to contain the ballast material in its entirety. A top is optional. Bolt this structure to the frame of the truck. Utilize a sufficient number of fasteners for attachment of the steel structure to the frame of the truck to ensure the structure will not part from the frame of the truck during an impact upon the attached truck mounted attenuator. Utilize either dry loose sand or steel reinforced concrete for ballast material within the

steel structure to achieve the necessary weight. The ballast material shall remain contained within the confines of the steel structure in its entirety and shall not protrude from the steel structure in any manner.

(J) Trailer-Mounted Changeable Message Signs (Sub-section 606.3.2) -

Sub-section 606.3.2.7 Controller (paragraphs 1-4) -

The controller shall be an electronic unit housed in a weatherproof, rust resistant box with a keyed lock and a light for night operation. Provide the unit with a jack that allows direct communications between the on-board controller and a compatible personal computer. The unit shall have a LCD display screen that allows the operator to review messages prior to displaying the message on the sign.

The controller shall have the capability to store 199 factory preprogrammed messages and up to 199 additional messages created by the user in a manner that does not require a battery to recall the messages. Also, the controller shall allow the operator the capability to program the system to display multiple messages in sequence.

Provide the controller with a selector switch to allow the operator to control the brightness or intensity level of the light source of the sign panel. The selector switch shall include "bright," "dim" and "automatic" modes; inclusion of additional modes is permissible. When the selector switch is in the "automatic" mode, a photosensitive circuit shall control the brightness or intensity level of the light source in response to changes in ambient light such as from day to night and other various sources of ambient light.

Equip each sign with remote communications capabilities, such as utilization of cellular telephone or internet browser technology, to allow the operator to revise or modify the message selection from the office or other remote location. Also, provide protection to prohibit unauthorized access to the controller, (i.e. password protection).

Sub-section 606.5 Measurement (paragraph 2) -

- Trailer-mounted changeable message signs are included in the lump sum item for Traffic Control in accordance with **Subsections 107.12** and **601.5** of the "2007 Standard Specifications for Highway Construction". No separate measurement will be made for trailer-mounted changeable message signs unless the contract includes a specific pay item for trailer-mounted changeable message signs.
- The Contractor shall provide, install, operate, and maintain the trailer-mounted changeable message sign per traffic control set-up as directed by the Plans, the "Standard Drawings for Road Construction", these Special Provisions, the Specifications, and the Engineer.

Sub-section 606.6 Payment (paragraph 2) -

In addition to **Subsections 107.12** and **601.6**, the payment for Traffic Control is full compensation for providing, installing, removing, relocating, operating, and maintaining trailer-mounted advance warning arrow panels and trailer-mounted changeable message signs as specified or directed and includes providing the units' primary power source; repairing or replacing damaged or malfunctioning units within the specified time; providing traffic control necessary for installing, operating, and maintaining the units; and all other materials, labor, hardware, equipment, tools, supplies, transportation, incidentals, and any miscellaneous items necessary to fulfill the requirements of the pay item in accordance with the Plans, the Specifications, and other items of the Contract.

Sub-section 606.6 Payment (paragraph 3) -

Disregard this paragraph unless the Contract includes a specific pay item for trailer-mounted changeable message signs.

(K) **Temporary Pavement Markings (Sub-section 609.4.1) –**

Sub-section 609.4.1.1.1 Application Requirements General (in addition to paragraph 3) -

On two-lane two-way roadways, apply and place temporary or permanent pavement markings, as specified hereupon, prior to the end of each day's work or shift or reopening a closed travel lane to traffic. These pavement markings shall include 4-inch wide solid lines on edge lines and solid center lines and 4-inch wide by 10 feet long broken lines with a 30-foot gap for broken center lines and lane lines unless otherwise specified. The center line pavement markings shall be either double yellow solid lines, yellow broken lines or an appropriate combination of a yellow solid line and yellow broken lines for passing / no passing zones. Placement of a singular yellow solid line for a center line pavement marking is unacceptable. The edge line pavement markings shall be a white solid line.

On multilane primary and secondary roadways, apply and place temporary or permanent pavement markings, as specified hereupon, to the travel lanes prior to reopening a closed travel lane to traffic. These pavement markings shall include 4-inch wide solid lines, utilized for edge lines and solid center lines, and 4-inch wide by 10 feet long broken lines with a 30-foot gap, utilized for lane lines and turn lanes, unless otherwise specified. The center line pavement markings shall be either double yellow solid lines or an appropriate combination of a yellow solid line and 4-inch wide by 10 feet long yellow broken lines for two-way left turn median areas. The right edge line pavement markings shall be a white solid line and the left edge line shall be a yellow solid line except in areas where the travel lanes separate to create a gore type situation and then the color schemes shall comply with SCDOT application practices for gore areas. The lane lines between travel lanes and turn lanes shall be 4-inch wide by 10 feet long white broken lines with a 30-foot gap.

However, on two-lane two-way and multilane primary and secondary roadways, application of a 4-inch wide solid line utilized for an edge line adjacent to an earth shoulder, white or yellow, may be delayed up to 72 hours after eradication of the original line when the length of eradicated line at a single location is no longer than 250 feet. In the event of multiple locations along the same line, each location must be separated from the adjacent location by no less than 250 feet with a cumulative total distance of eradicated line of no more than 1300 feet within any continuous 1 (one) mile length of roadway measured from a selected location. If the length of eradicated line exceeds 250 feet at any single location, the distance interval between multiple adjacent locations is less than 250 feet or a cumulative total distance of multiple locations of eradicated line exceeds 1300 feet within any continuous 1 (one) mile length of roadway measured from a selected location, replace the eradicated line(s) prior to reopening the adjacent travel lane to traffic.

On interstate roadways, apply and place temporary or permanent pavement markings, as specified hereupon, to the travel lanes prior to reopening a closed travel lane to traffic. These pavement markings shall include 6-inch wide solid lines, utilized for edge lines, and 6-inch wide by 10 feet long white broken lines with a 30-foot gap, utilized for lane lines between travel lanes and auxiliary lanes, unless otherwise specified. The right edge line pavement markings shall be a white solid line and the left edge line shall be a yellow solid line except in areas where the travel lanes separate to create a gore type situation and then the color schemes shall comply with SCDOT application practices for gore areas.

On all roadways, apply and place white stop bars and white triangle yield bars in all locations where previous stop bars and triangle yield bars have been eradicated by the work. Apply and place white stop bars and white triangle yield bars at intersections controlled by stop and yield signs within 72 hours of the eradication of the original pavement marking. Apply and place white stop bars at signalized intersections controlled by traffic control signals and at railroad crossings prior to reopening a closed travel lane to traffic.

Within the limits of existing turn lanes on all roadways, apply and place white arrows in all locations where previous arrows have been eradicated by the work unless otherwise directed by the RCE. Apply and place white arrows within 72 hours of the eradication of the original pavement markings. However, in regard to newly constructed turn lanes, apply and place white arrows the within turn lanes as directed by the RCE.

Within the limits of existing lane-drop sites on all roadways, apply and place white arrows in all locations where previous arrows have been eradicated by the work prior to the end of each day's work or shift or reopening the closed travel lane to traffic. In regard to newly constructed lane-drop sites, apply and

place white arrows within the travel lane to be terminated prior to opening the travel lane to traffic and as directed by the RCE.

(L) Temporary Pavement Markings (Sub-section 609.4.1) –

Sub-section 609.4.1.1.1 Application Requirements General (Revision to paragraph 8) -

On two-lane, two-way roadways, passing zones may be eliminated within the work zone through application of 4-inch double yellow centerline pavement markings if determined feasible and directed to do so by the Plans and/or the RCE. Apply no passing zone markings as specified by the Plans, the Specifications, the MUTCD and the RCE.

(M) Flagging Operations (Sub-section 610.4.1) –

Sub-section 610.4.1.1 Flagging Operations (paragraph 1) -

Use a flagging operation to control the flow of traffic when two opposing directions of traffic must share a common travel lane. A flagging operation may be necessary during a lane closure on a two-lane two-way roadway, an intermittent ramp closure or an intermittent encroachment of equipment onto a portion of the roadway. Utilize flagging operations to direct traffic around work activities and maintain continuous traffic flow at reduced speeds when determined to be appropriate by the RCE. As stated above, flagging operations shall direct traffic around the work activities and maintain continuous traffic flow, therefore, stopped traffic shall not be required to stop for time durations greater than those listed below unless otherwise directed by the RCE. Begin measurement of the time interval immediately upon the moment the Flagger rotates the Stop/Slow paddle to display the "Stop" condition to the approaching motorists.

LENGTH OF CLOSURE	MAXIMUM TIME DURATION FOR STOPPED TRAFFIC
1 MILE or LESS	5 Minutes
1 to 2 MILES	7 ½ Minutes

If the work activities require traffic to be stopped for periods greater than 5 to 7 ½ minutes as stated above, consider alternate work methods, conducting work activities during times of lowest traffic volumes such as during the hours of darkness or complete road closure with detour installation.

(N) Paving and Resurfacing (Sub-section 611.4.1) –

Sub-section 611.4.1.2 Requirements (paragraph 8) -

Whenever travel lanes with acceptable grade elevation differences are open to traffic, provide "Uneven Lanes" signs (W8-11-48) or "Uneven Pavement" signs (W8-11A-48). Reflectorize these signs with a fluorescent orange colored prismatic retroreflective sheeting unless otherwise specified. Install these signs adjacent to roadways with uneven pavement surfaces between travel lanes or between travel lanes and the adjacent paved shoulders. Install these signs at intervals no greater than 2600 feet.

WATER AND SEWER

Technical Specifications

June, 2021

These technical specifications include references to construction, testing and materials standards of various organizations. Note that all references, herein, apply unless they are superseded by any relevant or applicable requirements of SCDOT, SCDHEC, York County or any other Authorities having jurisdiction where the work is taking place.

dhec

DRINKING WATER AND RECREATIONAL WATER PROTECTION
WATER AND SEWER CONSTRUCTION ONLY
(Subject to any provisions which may appear in the construction permit)

Final written approval for operation must be obtained from DHEC after completion of construction.

Approved for:

Water Permit SS-000106
Wastewater Permit SS-02164

SC DHEC requires the submission of a separate set of project specific Pump Station Specifications for each project. Division 43 represent York County's Specifications for Sewer Pump Stations but they are not part of the overall SC DHEC approved Specifications.

SECTION 02 41 00

DEMOLITION

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. CONTRACTOR shall provide all labor, materials, equipment, and incidentals as shown, specified and required for demolition, removal, and disposal Work.
   2. The Work under this Section includes, but is not necessarily limited to:
      a. Demolition and removal of existing materials and equipment as shown or indicated in the Contract Documents. The Work includes demolition of piping, paving, curbs, sidewalks, gutters, fencing and similar existing facilities.
      b. For pump station Work, this may also include demolition of structural concrete, foundations, walls, doors, windows, structural steel, metals, roofs, masonry, attachments, appurtenances, electrical and mechanical systems and equipment, demolition and removal of all Underground Facilities underneath, and above-grade piping and utilities in, the building(s) and structures shown or indicated for demolition, unless the Underground Facilities or above-grade facilities are shown or indicated as to remain.
   3. Demolitions and removals specified under other Sections shall comply with requirements of this Section.
   4. Perform demolition Work within areas shown or indicated.
   5. Pay all costs associated with transporting and, as applicable, disposing of materials and equipment resulting from demolition.

B. Coordination:
   1. Comply with Section 01 14 16, Coordination with Owner's Operations.
   2. Review procedures under this and other Sections and coordinate the Work that will be performed with or before demolition and removals.

C. Related Sections:
   1. Section 01 73 29, Cutting and Patching.
   2. Section 31 11 00, Clearing and Grubbing.
   3. Section 31 23 16.26, Rock Removal.

1.2 QUALITY ASSURANCE

A. Qualifications:
   1. Electrical Removals: Entity and personnel performing electrical removals shall be electrician legally qualified to perform electrical construction and electrical work in the jurisdiction where the Site is located.
   2. Plumbing Removals: Entity and personnel performing plumbing removals shall be plumber legally qualified to perform plumbing construction and plumbing work in the jurisdiction where the Site is located.

B. Regulatory Requirements:

1. Demolition, removal, and disposal Work shall be in accordance with 29 CFR 1926.850 through 29 CFR 1926.860 (Subpart T - Demolition), and all other Laws and Regulations.
2. Comply with requirements of authorities having jurisdiction.

1.3 SUBMITTALS

A. Informational Submittals: Submit the following:
   1. Procedure Submittals:
      a. Demolition and Removal Plan: Not less than ten days prior to starting demolition Work, submit acceptable plan for demolition and removal Work, including:
         1) Plan for coordinating shut-offs, capping, temporary services, and continuing utility services.
         2) Other proposed procedures as applicable.
         3) Equipment proposed for use in demolition operations.
         4) Recycling/disposal facility(ies) proposed, including facility owner, facility name, location, and processes. Include copy of appropriate permits and licenses, and compliance status.
         5) Planned demolition operating sequences.
         6) Detailed schedule of demolition Work in accordance with the accepted Process Schedule.
   2. Qualifications Statements:
      a. Name and qualifications of entity performing electrical removals, including copy of licenses required by authorities having jurisdiction.
      b. Name and qualifications of entity performing plumbing removals, including copy of licenses required by authorities having jurisdiction.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 PREPARATION

A. Protection of Surrounding Areas and Facilities:
   1. Perform demolition and removal Work in manner that prevents damage and injury to property, structures, occupants, the public, and facilities. Do not interfere with use of, and free and safe access to and from, structures and properties.
   2. Closing or obstructing of roads, drives, sidewalks, and passageways adjacent to the Work is not allowed unless indicated otherwise in the Contract Documents. Conduct the Work with minimum interference to vehicular and pedestrian traffic.
   3. Provide temporary barriers, lighting, sidewalk sheds, and other necessary protection.
   4. Repair damage to facilities that are to remain.

B. Existing Utilities: In addition to requirements of the General Conditions and Division 01 Specifications, do the following:

1. Should uncharted or incorrectly charted Underground Facilities be encountered, CONTRACTOR responsibilities shall be in accordance with the General Conditions. Cooperate with utility owners in keeping adjacent services and facilities in operation.
2. Sanitary Sewer: Before proceeding with demolition, locate and cap all sewer lines and service laterals discharging from the building or structure being demolished.
3. Storm Water: Existing storm water system shall remain in place until demolitions of existing building or structure is completed. Upon completing demolition, cut and cap storm sewer laterals at locations shown on the Drawings. Remove existing storm water piping and related structures between points of cutting, and backfill, restore to grade, and stabilize the area over the removed facilities.
4. Water Piping: Before proceeding with demolition, locate and cap all potable and non-potable waterlines and service laterals serving the building or structure being demolished.
5. Other Utilities: Before proceeding with demolition, locate and cap as required all other utilities, such as fuel and gas; heating, ventilating, and air conditioning; electric; and communications; and service laterals serving the building or structure being demolished.
6. Shutdown of utility services shall be coordinated by CONTRACTOR, assisted by OWNER as required relative to contacting utility owners.

C. Remediation:
1. Prior to performing demolition Work that disturbs Asbestos, remove and dispose of Asbestos in accordance with Section 01 74 19, Construction and Demolition Waste Management.
2. Prior to performing demolition Work involving lead-based paint, remediate lead in accordance with Section 01 74 19, Construction and Demolition Waste Management.

3.2 DEMOLITION – GENERAL

A. Locate construction equipment used for demolition Work and remove demolished materials and equipment to avoid imposing excessive loading on adjacent facilities, and Underground Facilities.

B. Pollution Controls:
1. Use water sprinkling, temporary enclosures, and other suitable methods to limit emissions of dust and dirt to lowest practical level. Comply with Section 01 57 19, Temporary Environmental Controls, and Laws and Regulations.
2. Do not use water when water may create hazardous or objectionable conditions such as icing, flooding, or pollution.
3. Clean adjacent structures, facilities, properties, and improvements of dust, dirt, and debris caused by demolition Work, in accordance with the General Conditions.

C. Comply with Section 01 73 29, Cutting and Patching.

D. Building or Structure Demolition:
1. Unless otherwise approved by ENGINEER, proceed with demolition from top of building or structure to the ground. Complete demolition Work above each floor or tier before disturbing supporting members of lower levels.
2. Demolish concrete and masonry in small sections.
3. Remove structural framing members and lower to ground using hoists, cranes, or other suitable methods. Do not throw or drop to the ground.

4. Break up and remove foundations and slabs-on-grade unless otherwise shown or indicated as remaining in place.

E. Demolition of Site Improvements:
   1. Pavement, Sidewalks, Curbs, and Gutters: Demolition of asphalt or concrete pavement, sidewalks, curbs, and gutters, as applicable, shall terminate at cut edges. Edges shall be linear and have a vertical cut face.
   2. Fencing, Guardrails, and Bollards: Remove to the limits shown or indicated on the Drawings. Completely remove below-grade posts and concrete.
   3. Manholes, Vaults, Chambers, and Handholes: Remove to the limits shown or indicated on the Drawings and in accordance with Part 3 of this Section.
   4. Underground Facilities Other than Manholes, Vaults, Chambers, and Handholes: Remove to the extent shown or indicated on the Drawings. Unless otherwise shown or indicated, cap ends of piping to remain in place in accordance with the "Mechanical Removals" Article in this Section.
   5. Landscaping: Comply with Section 31 11 00, Clearing and Grubbing.

F. Salvage and Ownership:
   1. Refer to Section 01 11 13, Summary of Work, for requirements on salvage, ownership, and handling of equipment and materials removed during demolition and removal Work.
   2. Materials and equipment to remain OWNER's property shall be carefully removed and appropriately handled by CONTRACTOR to avoid damage and invalidation of warranties in effect, and shall be cleaned and stored at the Site (or other site specified in the Contract Documents) at place designated by ENGINEER or OWNER.

G. Finishing of Surfaces Exposed by Removals: Unless otherwise shown or indicated in the Contract Documents, surfaces exposed by removals, and that will remain as finished surfaces, shall be repaired and re-finished with materials that match existing adjacent surface, or as otherwise approved by ENGINEER.

3.3 ABANDONMENT OF EXISTING MANHOLES

A. Plug both influent and effluent lines inside the manhole with watertight masonry.

B. Fill manhole with non-compressible material (#67 stone or as approved), to a point three feet (3'-0") below the finish grade.

C. Remove remainder of manhole.

D. Fill excavation to finish grade with suitable soil compact in place.

3.4 ABANDONMENT OF MAINS AT MANHOLES WHICH REMAIN IN SERVICE

A. Completely disconnect main to be abandoned from the manhole by cutting the pipe outside the manhole and then plugging the abandoned main and the manhole wall with watertight masonry.

B. Rebuild the invert to conform with the standard details.

3.5 ABANDONMENT OF EXPOSED PIPE

A. Remove exposed sections of abandoned mains to a point not less than 5 feet into the adjacent banks.

B. Plug the remaining ends of the pipe with watertight masonry.

C. Remove completely concrete piers and collars in the creek channel.

D. Remove concrete piers, steel piers and collars not located in the creek channel to a point three feet (3'-0") below the finish grade.

3.6 ABANDONMENT OF EXISTING PUMP STATIONS

A. Salvage and transport pumps, motors, controls, etc. to the sewer maintenance yard in New Heritage.

B. Plug all influent and effluent pipes with watertight masonry.

C. Fill the pipe chamber and wetwell (if abandoned) with noncompressible material (#67 stone or as approved), to a point three feet (3'-0") below the finish grade.

D. Remove the remainder of the structure and fill the excavation to finish grade with suitable soil compacted in place.

E. Remove all above ground structures associated with the pump station, including fencing and the access road, and restore the area.

3.7 STRUCTURAL REMOVALS

A. Remove structures to lines and grades shown or indicated, unless otherwise directed by ENGINEER. Where limits are not shown or indicated, limits shall be four inches outside item to be installed. Removals beyond limits shown or indicated shall be at CONTRACTOR's expense and such excess removals shall be reconstructed to satisfaction of ENGINEER without additional cost to OWNER.

B. Recycling and Reuse of Demolition Materials:
   1. All concrete, brick, tile, masonry, roofing materials, reinforcing steel, structural metals, miscellaneous metals, plaster, wire mesh, and other items contained in or upon building or structure to be demolished shall be removed, transported, and disposed of away from the Site, unless otherwise approved by ENGINEER.
   2. Do not use demolished materials as fill or backfill adjacent to structures, in pipeline trenches, or as subbase under structures or pavement.

C. After removing concrete and masonry walls or portions thereof, slabs, and similar construction that ties into the Work or to existing construction, neatly repair the junction point to leave exposed only finished edges and finished surfaces.

D. Where equipment or material anchored to concrete or masonry are removed and anchors are not to be re-used, remove the anchors to not less than 1.5 inches beneath surface of concrete or masonry member. Repair the resulting hole, using repair mortar for concrete and grout for masonry, to be flush with the surface. Alternately, when the anchor is stainless

steel, the anchor may be cut flush with the surface of the concrete or masonry, when so approved by ENGINEER.

E. Where anchoring materials, including bolts, nuts, hangers, welds, and reinforcing steel, are required to attach the Work to existing construction, provide such materials under this Section, unless specified elsewhere in the Contract Documents.

3.8 MECHANICAL REMOVALS

A. Mechanical demolition and removal Work includes dismantling and removing existing piping, ductwork, pumps, equipment, tanks, and appurtenances as shown, indicated, and required for completion of the Work. Mechanical removals include cutting and capping as required, except that cutting of existing piping and ductwork to make connections is included under Section 01 14 16, Coordination with Owner's Operations; Section 01 73 29, Cutting and Patching; and applicable Sections of Division 40, Process Integration.

B. Demolition and Removals of Piping, Ductwork, and Similar Items:
   1. Purge piping and tanks (as applicable) of chemicals or fuel (as applicable) and make safe for removal and capping. Remove to the extent shown or indicated existing process, water, waste and vent, chemical, gas, fuel, and other piping. Remove piping to the nearest solid piping support, and provide caps on ends of remaining piping. Where piping to be demolished passes through existing walls to remain, cut off and cap pipe on each side of the wall.
   2. Caps, Closures, Blind Flanges, and Plugs:
      a. Provide closure pieces, such as blind flanges and caps, where shown or required to complete the Work.
      b. Where used in this Section, the term "cap" means the appropriate type closure for the piping or ductwork being closed, including caps, blind flanges, and other closures.
      c. Caps shall be compatible with the piping or ductwork to which the cap is attached, fluid-tight and gastight, and appropriate for the fluid or gas conveyed in the pipe or duct.
      d. Unless otherwise shown or indicated, caps shall be mechanically fastened, fused, or welded to pipe or duct. Plug piping with means other than specified in this Section only when so shown or indicated in the Contractor Documents or when allowed by ENGINEER.
   3. When Underground Facilities are altered or removed, properly cut and cap piping left in place, unless otherwise shown or indicated.
   4. Remove waste and vent piping, and ductwork to extent shown and cap as required. Where demolished vent piping, stacks, and ductwork passes through existing roofing, patch the roof with the same or similar materials. Completed patch shall be watertight and comply with roofing manufacturer's recommendations.
   5. Modifications to potable water piping and other plumbing and heating system work shall comply with Laws and Regulations. All portions of potable water system that have been modified or opened shall be hydrostatically tested and disinfected in accordance with the Contract Documents, and Laws and Regulations. Hydrostatically test other, normally-pressurized, plumbing piping and heating piping.

C. Equipment Demolition and Removals:

1. To the extent shown or indicated, remove existing process equipment; pumps; storage tanks; hoisting and conveying equipment; heating, ventilating, and air conditioning equipment; generators; and other equipment.
2. Where required, disassemble equipment to avoid imposing excessive loading on supporting walls, floors, framing, facilities, and Underground Facilities. Disassemble equipment as required for access through and egress from building or structure. Disassembly shall comply with Laws and Regulations. Provide required means to remove equipment from building or structure.
3. Remove control panels, operator stations, and instruments associated with equipment being removed, unless shown or indicated otherwise.
4. Remove fuel appurtenances as applicable, including fuel storage tanks. Dispose of tank contents in accordance with Laws and Regulations.
5. Remove equipment supports as applicable, anchorages, base, grout, and piping. Remove anchorage systems in accordance with the “Structural Removals” Article in this Section. Remove small-diameter piping back to header unless otherwise indicated.
6. Remove access platforms, ladders, and stairs related to equipment being removed, unless otherwise shown or indicated.
7. Equipment Salvage: The following entities may be interested in salvaging equipment to be removed under the Contract:
    a. Project Development Services, The Woodlands, Texas.

3.9 ELECTRICAL REMOVALS

A. Electrical demolition Work includes removing existing transformers, distribution switchboards, control panels, motors, starters, conduit and raceways, cabling, poles and overhead cabling, panelboards, lighting fixtures, switches, and miscellaneous electrical equipment, as shown, specified, or required.

B. Remove existing electrical equipment and fixtures to avoid damaging systems to remain, to keep existing systems in operation, and to maintain integrity of grounding systems.

C. Remove or modify motor control centers and switchgear as shown or indicated. Modified openings shall be cut square and dressed smooth to dimensions required for installation of equipment.

D. Disconnect and remove motors, control panels, and other electrical gear where shown or indicated. Motors, microprocessors and electronics, other electrical gear to be reused shall be stored in accordance with Section 01 66 00, Product Storage and Handling Requirements.

E. Cables in conduits to be removed shall be removed back to the power source or control panel, unless otherwise shown or indicated. Verify the function of each cable before disconnecting and removing.

F. Conduits, raceways, and cabling shall be removed where shown or indicated. Abandoned conduits concealed in floor, ceiling slabs, or in walls shall be cut flush with the slab or wall (as applicable) at point of entrance, suitably capped, and the area repaired in a flush, smooth manner acceptable to ENGINEER. Exposed conduits, junction boxes, other electrical appurtenances, and their supports shall be disassembled and removed. Repair all areas of the Work to prevent rusting on exposed surfaces.

G. Conduits in Underground Facilities not scheduled for reuse shall be suitably capped watertight where each enters building or structure to remain.

H. Where shown or indicated, remove direct burial cable. Openings in buildings for entrance of direct burial cable shall be patched with repair mortar or other material approved by ENGINEER for this purpose and made watertight.

I. Existing poles and overhead cables shall be removed or abandoned as shown and specified. Existing substation(s) and poles owned by electric utility will be removed by the electric utility. Completely remove from the Site poles not owned by electric utility and shown or indicated for removal. Make necessary arrangements with electric utility for removal of utility company's transformers and metering equipment after new electrical system has been installed and energized.

J. Lighting fixtures, wall switches, receptacles, starters, and other miscellaneous electrical equipment, not designated as remaining as OWNER's property, shall be removed and properly disposed off-Site as required.

3.10 DISPOSAL OF DEMOLITION DEBRIS

A. Remove from the Site all debris, waste, rubbish, and material resulting from demolition operations and equipment used in demolition Work. Comply with the General Conditions and Section 01 74 19, Construction and Demolition Waste Management.

B. Transportation and Disposal:
   1. Non-hazardous Material: Properly transport and dispose of non-hazardous demolition debris at appropriate landfill or other suitable location, in accordance with Laws and Regulations. Non-hazardous material does not contain Asbestos, PCBs, Petroleum, Hazardous Waste, Radioactive Material, or other material designated as hazardous in Laws and Regulations.
   2. Hazardous Material: When handling and disposal of hazardous materials is included in the Work, properly transport and dispose of hazardous materials in accordance with the Contract Documents and Laws and Regulations.

C. Submit to ENGINEER information required in this Section on proposed facility(ies) where demolition material will be recycled. Upon request, ENGINEER or OWNER, shall be allowed to visit recycling facility(ies) to verify adequacy and compliance status. During such visits, recycling facility operator shall cooperate and assist ENGINEER and OWNER.

END OF SECTION

SECTION 03 00 05

CONCRETE

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. CONTRACTOR shall provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install concrete, reinforcing, and related materials.
   2. The Work includes:
      a. Providing concrete consisting of portland cement, fine and coarse aggregates, water, and approved admixtures; combined, mixed, transported, placed, finished, and cured.
      b. Fabricating and placing reinforcing, including ties and supports.
      c. Design, erection, and removal of formwork.
      d. Building into the concrete all sleeves, frames, anchorage devices, inserts, and other items required to be embedded in concrete.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate installation of items to be installed in the concrete Work.

C. Classifications of Concrete:
   1. Class “A” concrete shall be steel-reinforced and includes all concrete unless otherwise shown or indicated, and includes the following:
      a. Structural concrete for load bearing walls.
      b. Columns.
      c. Beams.
      d. Elevated floor slabs.
      e. Unlined or uncoated water/liquid containment structures.
   2. Class “B” concrete shall be placed without forms or with simple forms, with little or no reinforcing and includes the following:
      a. Concrete fill.
      b. Duct banks.
      c. Unreinforced encasements.
      d. Curbs and gutters.
      e. Sidewalks.
      f. Thrust blocks.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ACI 224R, Control of Cracking in Concrete Structures.
   2. ACI 301, Specifications for Structural Concrete for Buildings.
   3. ACI 304R, Guide for Measuring, Mixing, Transporting and Placing Concrete.

27. ASTM C881/C881M, Specification for Epoxy-Resin-Base Bonding Systems for Concrete.
28. ASTM C1064/C1064M, Standard Test Method for Temperature of Freshly Mixed Hydraulic-Cement Concrete.
29. ASTM D1752, Specification for Preformed Sponge Rubber Cork and Recycled PVC Expansion Joint Fillers for Concrete Paving and Structural Construction.
30. ASTM E96/E96M, Test Methods for Water Vapor Transmission of Materials
31. ASTM E154, Test Methods for Water Vapor Retarders Used in Contact with Earth Under Concrete Slabs, on Walls, or as Ground Cover.
32. CRD-C 572, U. S. Army Corps of Engineers Specification for Polyvinylchloride Waterstops.
33. CRSI 1MSP, Manual of Standard Practice.

1.3 QUALITY ASSURANCE

A. Laboratory Trial Batch:
   1. Employ independent testing laboratory currently certified by the Cement and Concrete Reference Laboratory and experienced in design and testing of concrete materials and mixes to perform material evaluation tests and to design concrete mixes.
   2. Each concrete mix design specified shall be verified by laboratory trial batch, unless indicated otherwise.
   3. Laboratory personnel shall be ACI-certified.
   4. Perform the following testing on each trial batch:
      a. Aggregate gradation for fine and coarse aggregates.
      b. Slump.
      c. Air content.

d. Compressive strength based on three cylinders each tested at seven days and at 28 days.

5. Submit for each trial batch the following information:
   a. Project identification name and number (if applicable).
   b. Date of test report.
   c. Complete identification of aggregate source of supply.
   d. Tests of aggregates for compliance with the Contract Documents.
   e. Scale weight of each aggregate.
   f. Absorbed water in each aggregate.
   g. Brand, type, and composition of cementitious materials.
   h. Brand, type, and amount of each admixture.
   i. Amounts of water used in trial mixes.
   j. Proportions of each material per cubic yard.
   k. Gross weight and yield per cubic yard of trial mixtures.
   l. Measured slump.
   m. Measured air content.
   n. Compressive strength developed at seven days and 28 days, from not less than three test cylinders cast for each seven day and 28-day test, and for each design mix.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. List of concrete materials and concrete mix designs proposed for use. Include results of tests performed to qualify the materials and to establish the mix designs. Do not start laboratory trial batch testing until this submittal is approved by ENGINEER.
      b. Laboratory Trial Batch Reports: Submit laboratory test reports for concrete cylinders, materials, and mix design tests.
      c. Concrete placement drawings showing the location and type of all joints.
      d. Drawings for fabricating, bending, and placing concrete reinforcing. Comply with ACI SP-66. For walls and masonry construction, provide elevations to a minimum scale of 1/4-inch to one foot. Show bar schedules, stirrup spacing, adhesive dowels, splice lengths, diagrams of bent bars, arrangements, and assemblies, as required for fabricating and placing concrete reinforcing.
   2. Product Data:
      a. Manufacturer’s specifications with application and installation instructions for proprietary materials and items, including admixtures and bonding agents.
   3. Samples:
      a. Samples: Submit samples of materials as specified and as otherwise requested by ENGINEER, including names, sources, and descriptions.

B. Informational Submittals: Submit the following:
   1. Site Quality Control Submittals:
      a. Report of testing results for testing of field concrete cylinders for each required time period. Submit within 24 hours after completion of associated test. Test report shall include results of all testing required at time of sampling.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Transportation, Delivery, and Handling:

1. Deliver concrete reinforcing products to Site bundled, tagged, and marked. Use metal tags indicating bar size, lengths, and other information corresponding to markings on approved Shop Drawings.
2. Materials used for concrete shall be clean and free from foreign matter during transportation and handling, and kept separate until measured and placed into concrete mixer.
3. Implement suitable measures during hauling, piling, and handling to ensure that segregation of coarse and fine aggregate particles does not occur and grading is not affected.
4. Deliver grout materials from manufacturers in unopened containers that bear intact manufacturer labeling.
5. Comply with Section 01 65 00, Product Delivery Requirements.

B. Storage:
1. Store formwork materials above ground on framework or blocking. Cover wood for forms and other accessory materials with protective, waterproof covering. Provide for adequate air circulation or ventilation under cover.
2. Store concrete reinforcing materials to prevent damage and accumulation of dirt and excessive rust. Store on heavy wood blocking so that reinforcing does not come into contact with the ground. Space framework or blocking supports to prevent excessive deformation of stored materials.
3. Store concrete joint materials on platforms or in enclosures or covered to prevent contact with ground and exposure to weather and direct sunlight.
4. For storage of concrete materials, provide bins or platforms with hard, clean surfaces.
5. Comply with Section 01 66 00, Product Storage and Handling Requirements.

PART 2 PRODUCTS

2.1 CONCRETE MATERIALS

A. Portland Cement: Provide the type of cement required by the environmental conditions and exposures defined by ASTM C150/C150M:
1. Type I/ Type IA: Normal/ Normal, air-entraining.
2. Type II/ Type IIA: Moderate sulfate resistance/ Moderate sulfate resistance, air-entraining.

B. Aggregates: ASTM C33/C33M.
1. Fine Aggregate: Clean, sharp, natural sand, manufactured sand or a combination thereof free of loam, clay, lumps, and other deleterious substances. Dune sand and bank run sand are unacceptable.
   a. Shall conform to the sieve analysis in accordance with ACI Standards with the following exceptions:
      1) The percent passing a No. 50 sieve shall not exceed 6%.
      2) The percent passing a No. 100 sieve shall be 0%.
2. Coarse Aggregate:
   a. Clean, uncoated, processed, uniformly and evenly graded aggregate containing no clay, mud, loam, or foreign matter.
   b. Coarse aggregate shall comply with the following:
      1) Sound, crushed, angular granitic stone.

2) Washed gravel, either natural or crushed. Slag, pit gravel, bank-run gravel, smooth or rounded stone are not allowed.

c. Coarse Aggregate Size:
1) Reinforced Concrete: ASTM C33/C33M, Nos. 57 or 67, unless otherwise approved by ENGINEER.
2) Unreinforced Slabs or Pavement: ASTM C33/ C33M, No. 467.

C. Water: Clean, potable.

D. Admixtures:
1. Air-Entraining Admixture: ASTM C260.
2. Water-Reducing Admixture: ASTM C494/C494M, Type A.
3. Water Reducing and Set-Adjusting Admixtures: ASTM C494/C494M, Types D and E.
4. High Range Water-Reducing Admixture: ASTM C494/C494M, Type F/G.
5. Use only admixtures that have been tested and approved in the mix designs.
6. Do not use calcium chloride in excess of 1% by cement weight. If concrete is used with reinforcing steel, no calcium chloride shall be used.
7. Do not use other admixtures containing chloride ions.

2.2 CONCRETE MIX

A. General:
1. Normal weight: 145 pounds per cubic foot.
2. Use air-entraining admixture in all concrete unless restricted by the manufacturer for floor hardness treatments or coating systems if specified. Provide not less than four percent, nor more than six percent, entrained air for concrete.

B. Proportioning and Design of Class “A” Concrete Mix:
1. Minimum compressive strength at 28 days: 4,500 psi.
2. Maximum water-cement ratio by weight: 0.42.
3. Minimum cement content: 564 pounds per cubic yard.

C. Proportioning and Design of Class “B” Concrete Mix:
1. Minimum compressive strength at 28 days: 3,500 psi.
2. Maximum water-cement ratio by weight: 0.50.
3. Minimum cement content: 517 pounds per cubic yard.

D. Slump Limits:
1. Proportion and design mixes to result in concrete slump at point of placement of not less than three inches and not more than five inches.
2. When using high-range water reducers, slump prior to addition of admixture shall not exceed three inches. Slump after adding admixture shall not exceed eight inches at point of placement.

E. Adjustment of Concrete Mixes:
1. Concrete mix design adjustments may be requested by CONTRACTOR when warranted by characteristics of materials, Site conditions, weather, test results, or other, similar circumstances.
2. Submit for ENGINEER’s approval laboratory test data for adjusted concrete mix designs, including compressive strength test results.
3. Implement adjusted mix designs only after ENGINEER’s approval.

4. Adjustments to concrete mix designs shall not result in additional costs to OWNER.

2.3 FORM MATERIALS

A. Provide form materials of wood, plywood, metal or material approved by Engineer with sufficient stability to withstand pressure of placed concrete without bow or deflection. CONTRACTOR shall be responsible for designing the formwork system to resist all applied loads including the pressures from fluid concrete and construction loads, including vibration during placement and rate of speed at which forms are to be filled.

B. Smooth Form Surfaces: Acceptable panel-type to provide continuous, straight, smooth, as-cast surfaces in accordance with ACI 301.

C. Unexposed Concrete Surfaces: Material to suit project conditions.

D. Provide 3/4-inch chamfer at all external corners. Chamfer is not required at re-entrant corners unless otherwise shown or indicated.

E. Form Ties:
   1. Provide factory-fabricated, removable, or snap-off metal form ties, that prevent form deflection and prevent spalling of concrete surfaces upon removal. Materials used for tying forms are subject to approval of ENGINEER.
   2. Unless otherwise shown or indicated, provide ties so that portion remaining within concrete after removal of exterior parts is at least 1.5 inches from outer surface of concrete. Unless otherwise shown or indicated, provide form ties that, upon removal, will leave a uniform, circular hole not larger than one-inch diameter in the concrete surface.
   3. Ties for exterior walls, below-grade walls, and walls subject to hydrostatic pressure shall be provided with waterstops.
   4. Wire ties are unacceptable.

2.4 REINFORCING MATERIALS

A. Reinforcing Bars: ASTM A615/A615M, Grade 60 deformed bars.

B. Welded Wire Fabric: ASTM A185/A185M.

C. Steel Wire: ASTM A82/A82M.

D. Provide supports for reinforcing including bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing in place.
   1. Use wire bar-type supports complying with CRSI MSP1 recommendations, except as specified in this Section. Do not use wood, brick, or other unacceptable materials.
   2. For slabs on grade, use precast concrete blocks, four inches square minimum with compressive strength equal to or greater than the surrounding concrete, or supports with sand plates or horizontal runners where base materials will not support chair legs.
   3. For all concrete surfaces where legs of supports are in contact with forms, provide supports having either hot-dip galvanized, plastic-protected, or stainless steel legs in accordance with CRSI MSP1.
   4. Provide precast concrete supports over waterproof membranes.

E. Adhesive Dowels:

1. Dowels:
   a. Dowel reinforcing bars shall comply with ASTM A615, Grade 60.
2. Adhesive:
   a. Adhesive system shall use two-component adhesive mix.
   b. Epoxy adhesives shall comply with physical requirements of ASTM C881/C881M, Type IV, Grade 2 and 3, Class A, B, and C, except gel times.
   c. Adhesives shall have a current evaluation report by ICC Evaluation Service for use in both cracked and uncracked concrete with seismic recognition for SDC A through F as tested and assessed in accordance with ICC-ES AC308.
   d. Adhesives shall have minimum bond strength and minimum design bond strength (bond strength multiplied by strength reduction factor) in accordance with Table 03 00 05-A:

TABLE 03 00 05-A:
ADHESIVE BOND STRENGTH [1,2]

Anchor	Uncracked Concrete		Cracked Concrete	
Rod Diameter / Dowel Size	**Bond Strength (psi)**	**Design Bond Strength (psi)**	**Bond Strength (psi)**	**Design Bond Strength (psi)**
3/8-inch / #3	2040	1300	1090	700
1/2-inch / #4	1920	1200	920	560
5/8-inch / #5	1830	1150	710	390
3/4-inch / #6	1760	1050	710	460
7/8inch / #7	1670	900	610	340
1-inch / #8	1650	1050	850	460
- / #9	1900	1000	800	400
1.25-inch/ #10	1580	1000	730	400

Table Notes:
1. Bond strengths listed for hammer-drilled, dry hole.
2. Bond strengths listed for maximum short term concrete temperature of 110 degrees F and maximum long term concrete temperature of 75 degrees F.

2.5 RELATED MATERIALS

A. Waterstops:
   1. PVC Waterstops:
      a. Manufacturers: Provide products of one of the following:
         1) W.R. Meadows, Inc.
         2) Greenstreak Plastic Products Company.
         3) Or equal.
      b. Waterstops shall comply with CRD-C 572. Do not use reclaimed or scrap material.
      c. Minimum Thickness: 3/8-inch.
      d. Provide waterstops with minimum of seven ribs equally spaced at each end on each side with the first rib located at the edge. Each rib shall be minimum 1/8-inch in height.
      e. Construction Joints: Waterstops shall be six-inch wide flat-strip type.
      f. Expansion Joints: Waterstops shall be nine-inch wide centerbulb type.
   2. Hydrophilic Waterstops:
      a. Products and Manufacturers: Provide one of the following:

1) Duroseal Gasket, by BBZ USA, Inc.
2) Adeka Ultraseal MC-2010M, by Asahi Denka Kogyo K.K.
3) Hydrotite, by Greenstreak Plastic Products Company.
4) Or equal.

b. Hydrophilic waterstop materials shall be bentonite-free and shall expand by minimum of 80 percent of dry volume in the presence of water to form a watertight joint seal without damaging the concrete in which it is cast.
c. Waterstop material shall be composed of resins and polymers that absorb water and cause a completely reversible and repeatable increase in volume.
d. Waterstop material shall be dimensionally stable after repeated wet-dry cycles with no deterioration of swelling potential.
e. Select material in accordance with manufacturer's recommendations for type of liquid to be contained.
f. Minimum cross-sectional dimensions: 3/16-inch by 3/4-inch.
g. Location of hydrophilic waterstops shall be as shown or indicated on the Drawings, or where approved by ENGINEER.
h. Hydrophilic Sealant: Shall adhere firmly to concrete, metal, and PVC in dry or damp condition and be indefinitely elastic when cured.
1) Products and Manufacturers: Provide one of the following:
a) Duroseal Paste, by BBZ USA, Inc.
b) Adeka Ultraseal P-201, by Asahi Denka Kogyo K.K.
c) Hydrotite, by Greenstreak Plastic Products Company.
d) Or equal.

B. Membrane-Forming Curing Compound: ASTM C309, Type II.

C. Epoxy Bonding Agent:
1. Two-component epoxy resin bonding agent.
2. Products and Manufacturers: Provide one of the following:
a. Sikadur 32, Hi-Mod LPL, by Sika Corporation.
b. Eucopoxy LPL, by the Euclid Chemical Company.
c. Or equal.

D. Epoxy-Cement Bonding Agent:
1. Three-component blended epoxy resin-cement bonding agent.
2. Products and Manufacturers: Provide one of the following:
a. Sika Armatec 110 EpoCem, by Sika Corporation.
b. Duralprep A.C., by Euclid Chemical Company.
c. Or equal.

E. Preformed Expansion Joint Filler:
1. Provide preformed expansion joint filler complying with ASTM D1752, Type I (sponge rubber) or Type II (cork).

F. Joint Sealant and Accessories:
1. For joint sealants and accessories used on isolation joints, control joints, and expansion joints, refer to Section 07 92 00, Joint Sealants.

2.6 GROUT

A. Non-shrink Grout:

1. Pre-packaged, non-metallic, cementitious grout requiring only the addition of water at the Site. In accordance with ASTM C1107.
2. Minimum 28-day Compressive Strength: 7,500 psi.
3. Bond Strength: 1,350 to 1,700 psi.
4. Percent Expansion: 0.25% to 0.75%.
5. Products and Manufacturers: Provide one of the following:
    a. NS Grout by Euclid Chemical Company.
    b. Set Grout by Master Builders, Inc.
    c. Embeco 636 by Master Builders, Inc.
    d. d. NBEC Grout by Five Star Products, Inc.
    e. Or equal.

2.7 MORTAR

A. Mortar uses in sanitary sewer manholes shall be hydraulic cement mortar in accordance with ASTM C-398.

B. Mortar used in water meter vaults and water valve vaults shall be Type M in accordance with ASTM C-270.

PART 3 EXECUTION

3.1 INSPECTION

A. CONTRACTOR shall examine the substrate and the conditions under which the Work will be performed and notify ENGINEER in writing of unsatisfactory conditions. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 FORMWORK

A. Construct formwork in accordance with ACI 347 such that concrete members and structures are of correct size, shape, alignment, elevation, and position.

B. Provide openings in formwork to accommodate the Work of other trades. Accurately place and securely support items required to be built into formwork.

C. Clean and adjust forms prior to placing concrete. Apply form release agents or wet forms as required. Re-tighten forms during and after concrete placing, when required, to eliminate cement paste leaks.

D. Removing Formwork:
1. Comply with ACI 301 and ACI 347, except as otherwise indicated in the Contract Documents.
2. Do not remove formwork and shoring until supported concrete members have acquired minimum of 90 percent of specified compressive strength. Results of suitable quality control tests of field-cured specimens may be submitted to ENGINEER for review as evidence that concrete has attained sufficient strength for removal of supporting formwork and shoring prior to removal times indicated in the Contract Documents.
3. Removal time for formwork is subject to ENGINEER's acceptance. Forms shall be left in place for a minimum of 7 days.

4. Repair form tie-holes following in accordance with ACI 301.
5. Do not remove formwork and backfill before end of curing period without approval of Engineer. In such cases where Engineer approves early removal of forms, newly-exposed surfaces shall be cured in accordance with Part 3 of this specification.

3.3 REINFORCING, JOINTS, AND EMBEDDED ITEMS

A. Comply with the applicable recommendations of Laws and Regulations and standards referenced in this Section, including CRSI MSP1, for details and methods of placing and supporting reinforcing.

B. Clean reinforcing to remove loose rust and mill scale, earth, ice, and other materials which act to reduce or destroy bond between reinforcing material and concrete.

C. Position, support, and secure reinforcing against displacement during formwork construction and concrete placing. Locate and support reinforcing by means of metal chairs, runners, bolsters, spacers, and hangers, as required.
   1. Place reinforcing to obtain minimum concrete coverages as shown on the Drawings and as required in ACI 318. Arrange, space, and securely tie bars and bar supports together with 16-gage wire to hold reinforcing accurately in position during concrete placing. Set with ties so that twisted ends are directed away from exposed concrete surfaces.
   2. Do not secure reinforcing to formwork using wire, nails or other ferrous metal. Metal supports subject to corrosion shall not be in contact with formed or exposed concrete surfaces.

D. Provide sufficient quantity of supports of strength required to carry reinforcing. Do not place reinforcing more than two inches beyond the last leg of continuous bar support. Do not use supports as bases for runways for concrete conveying equipment and similar construction loads.

E. Splices: Provide standard reinforcing splices by lapping ends, placing bars in contact, and tying tightly with wire. Comply with requirements shown or indicated for minimum lap of spliced bars, as shown on the Drawings.

F. Install welded wire fabric in lengths as long as practical, lapping adjoining sections a minimum of one full mesh.

G. Do not place concrete until reinforcing is inspected and ENGINEER indicates that conditions are acceptable for placing concrete. Concrete placed in violation of this paragraph shall be rejected. Notify ENGINEER in writing at least two working days prior to proposed concrete placement.

H. Joints:
   1. Provide construction, isolation, expansion, and control joints as indicated or required. Locate construction joints so as to not impair the strength and appearance of the structure. Place isolation and control joints in slabs-on-grade to stabilize differential settlement and random cracking.
   2. In walls, locate joints at a maximum spacing of 40 feet and approximately 12 feet from corners.
   3. In foundation slabs and slabs-on-grade, locate joints at intervals of approximately 40 feet.
   4. In mats and structural slabs and beams, locate joints in compliance with ACI 224R.

5. Locations of joints shall be in accordance with the Contract Documents and as approved by ENGINEER in the Shop Drawings.
6. Where construction joints are indicated to be roughened, intentionally roughen surfaces of previously-placed concrete to amplitude of 1/4-inch.

I. Installation of Embedded Items: Do not embed in concrete uncoated aluminum items. Where aluminum items are in contact with concrete surfaces, coat aluminum to prevent direct contact with concrete.

J. Adhesive Dowels:
1. Adhesive dowels shall be reinforcing bar dowels set in an adhesive in hole drilled into hardened concrete. Comply with adhesive system manufacturer's installation instructions regarding hole diameter, drilling method, embedment depth required to fully develop required tensile strength, and hole cleaning and preparation instructions. Unless more-stringent standards are required by adhesive system manufacturer, comply with the following.
2. Drill holes to adhesive system manufacturer's recommended diameter and depth to develop required tensile strength. Holes shall not be more than 1/4-inch greater than nominal bar diameter, and hole depth shall not be less than twelve times nominal bar diameter. Hammer-drill holes. Cored holes are not allowed.
3. Embedment depths shall be based on concrete compressive strength of 2,000 psi when embedded in existing concrete, and 4,000 psi when embedded in new concrete.
4. Determine location of existing reinforcing steel in vicinity of proposed holes prior to drilling. Adjust location of holes to be drilled to avoid drilling through or damaging existing reinforcing bars only when approved by ENGINEER.
5. Before setting adhesive dowel, hole shall be free of dust and debris using method recommended by adhesive system manufacturer. Hole shall be brushed, with manufacturer-approved brush and blown clean with clean, dry, oil-free compressed air to remove dust and loose particles. Hole shall be dry as defined by adhesive system manufacturer.
6. Inject adhesive into hole through injection system mixing nozzle and necessary extension tubes, placed to bottom of hole. Withdraw discharge end as adhesive is placed, but keep end of tube immersed to prevent forming air pockets. Fill hole to depth that ensures that excess material is expelled from hole during dowel placement.
7. Twist dowels during insertion into partially-filled hole to guarantee full wetting of bar surface with adhesive. Insert bar slowly to avoid developing air pockets.

3.4 CONCRETE PLACING

A. Site Mixing: Use drum-type batch machine mixer, mixing not less than 1.5 minutes for one cubic yard or smaller capacity. Increase required mixing time by minimum of 15 seconds for each additional cubic yard or fraction thereof.

B. Ready-Mixed Concrete: Comply with ASTM C94/C94M.

C. Concrete Placing:
1. Place concrete in a continuous operation within planned joints or sections in accordance with ACI 304R.
2. Do not begin placing concrete until work of other trades affecting concrete is completed.
3. Wet concrete and subgrade surfaces to saturated surface dry condition immediately prior to placing concrete.

4. Deposit concrete as near its final location as practical to avoid segregation due to re-handling or flowing.
5. Avoid separation of the concrete mixture during transportation and placing. Concrete shall not free-fall for distance greater than four feet during placing.
6. Complete concrete placing within 90 minutes of addition of water to the dry ingredients.

D. Consolidate placed concrete in accordance with ACI 309R using mechanical vibrating equipment supplemented with hand rodding and tamping, such that concrete is worked around placing and other embedded items and into all parts of formwork. Insert and withdraw vibrators vertically at uniformly-spaced locations. Do not use vibrators to transport concrete within the formwork. Vibration of formwork or placing is not allowed.

E. Protect concrete from physical damage or reduced strength due to weather extremes during mixing, placing, and curing.
1. In hot weather comply with ACI 305R.
2. In cold weather comply with ACI 306R.

3.5 QUALITY OF CONCRETE WORK

A. Make concrete solid, compact, smooth, and free of laitance, cracks, and cold joints.

B. Concrete for liquid-retaining structures and concrete in contact with earth, water, or exposed directly to the elements shall be watertight.

C. Cut out and properly replace to extent directed by ENGINEER, or repair to satisfaction of ENGINEER, surfaces that contain cracks or voids, are unduly rough, or are in defective in any way. Patches or plastering are unacceptable.

D. Repair, removal and replacement of defective concrete directed by ENGINEER shall be at no additional cost to OWNER.

3.6 CURING

A. Begin initial curing as soon as free water has disappeared from exposed surfaces. Where possible, keep continuously moist for not less than 7 hours. Continue curing by using moisture-retaining cover or membrane-forming curing compound, or by keeping exposed surfaces moist continuously for entire curing period. Cure formed surfaces by moist curing until formwork is removed. Provide protection, as required, to prevent damage to exposed concrete surfaces. Total curing period shall not be less than seven days. Curing methods and materials shall be compatible with scheduled finishes.

3.7 FINISHING

A. Slab Finish:
1. After placing concrete slabs, do not work the surface further until ready for floating. Begin floating when surface water has disappeared or when concrete has stiffened sufficiently. Use a wood float only. Check and level surface plane to a tolerance not exceeding 1/4-inch in ten feet when tested with a ten foot straightedge placed on the surface at not less than two different angles. Cut down high spots and fill low spots. Uniformly slope surfaces to drains. Immediately after leveling, re-float the surface to a uniform, smooth, granular

texture. Slab surfaces shall receive a float finish. Provide additional trowel finishing as required in this Section.

2. After floating, begin first trowel finish operation using power-driven trowel. Begin final troweling when surface produces a ringing sound as trowel is moved over the surface.
3. Consolidate concrete surface by the final hand troweling operation. Finish shall be free of trowel marks, uniform in texture and appearance, and with a surface plane tolerance not exceeding 1/8-inch in ten feet when tested with a ten-foot straightedge. Grind smooth surface defects that would telegraph through applied floor covering system.
4. Use trowel finish for the following:
   a. Interior exposed slabs, unless otherwise shown or indicated.
   b. Apply non-slip broom finish, after troweling, to exterior concrete slab and elsewhere as shown.

B. Apply chemical floor hardener to exposed interior concrete floor areas when cured and dry, in accordance with hardener manufacturer's instructions.

C. Formed Finish:
1. Provide smooth form concrete finish at exposed surfaces. Use largest practical form panel sizes to minimize form joints. Exposed surfaces include interior water-contacting surfaces of tanks, whether or not directly visible. All surfaces shall be considered as exposed, unless buried or covered with permanent structural or architectural material. After removing forms, patch form tie holes and defects in accordance with ACI 301. Remove fins exceeding 1/8-inch in height. Where surface will be coated or will receive further treatment, remove all fins flush with concrete surface.
2. Provide rough form finish at all unexposed surfaces. After removing forms, patch form tie holes and defects in accordance with ACI 301. Remove fins exceeding 1/2-inch in height.

3.8 GROUT PLACING

A. Place grout as shown and indicated, and in accordance with grout manufacturer's instructions and recommendations. If grout manufacturer's instructions conflict with the Contract Documents, notify ENGINEER and not proceed until obtaining ENGINEER's clarification.

B. Dry-packing is not allowed, unless otherwise indicated.

C. Manufacturers of proprietary grout materials shall make available upon 72 hours notice the services of qualified, full-time, factory-trained employee to aid in ensuring proper use of grout materials at the Site.

D. Placing grout shall comply with temperature and weather limitations described in Article 3.4 of this Section.

3.9 FIELD QUALITY CONTROL

A. Site Testing Services:
1. Employ independent testing laboratory to perform field quality control testing for concrete. ENGINEER will direct where samples are obtained.
2. Testing laboratory will provide all labor, material, and equipment required for sampling and testing concrete, including: scale, glass tray, cones, rods, molds, air tester, thermometer, and other incidentals required.

3. Provide curing and necessary cylinder storage in accordance with Section 01 45 29, Testing Laboratory Services.

B. Quality Control Testing During Construction:
   1. Perform sampling and testing for field quality control during concrete placing, as follows:
      a. Sampling Fresh Concrete: ASTM C172.
      b. Slump: ASTM C143/C143M; one test for each concrete load at point of discharge.
      c. Concrete Temperature: ASTM C1064/C1064M; one for every two concrete loads at point of discharge, and when a change in the concrete is observed. Test each load when time from batching to placement exceeds 75 minutes.
      d. Air Content: ASTM C231; one for every two concrete load at point of discharge, and when a change in the concrete is observed.
      e. Unit Weight: ASTM C138/C138M; one for every two concrete loads at point of discharge, and when a change in the concrete is observed.
      f. Compression Test Specimens:
         1) In accordance with ASTM C31/C31M, make one set of compression cylinders for each 50 cubic yards of concrete, or fraction thereof, of each mix design placed each day. Each set shall be four standard cylinders, unless otherwise directed by ENGINEER.
         2) Cast, store, and cure specimens in accordance with ASTM C31/C31M.
      g. Compressive Strength Tests:
         1) In accordance with ASTM C39/C39M; one specimen tested at seven days, and three specimens tested at 28 days.
         2) Concrete that does not comply with strength requirements shall be considered as defective Work.
      h. Submit test results from certified by testing laboratory to ENGINEER within 24 hours of completion of test.
      i. When there is evidence that strength of in-place concrete does not comply with the Contract Documents, CONTRACTOR shall employ the services of concrete testing laboratory to obtain cores from hardened concrete for compressive strength determination. Cores and tests shall comply with ASTM C42/C42M and the following:
         1) Testing of Adhesive Dowels: CONTRACTOR shall employ testing agency to perform field quality control testing of drilled dowel installations. After adhesive system manufacturer's recommended curing period and prior to placing connecting reinforcing, proof-test for pullout ten percent of adhesive dowels installed. Adhesive dowels shall be tensioned to 60 percent of specified yield strength. Where dowels are located less than six bar diameters from edge of concrete, ENGINEER shall determine tensile load required for test. If one or more dowels fail, retest all dowels installed for the Work. Dowels that fail shall be reinstalled and retested at CONTRACTOR's expense.

END OF SECTION

SECTION 05 50 13

MISCELLANEOUS METAL FABRICATIONS

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish miscellaneous metal fabrications including surface preparation and shop priming.
   2. The Work also includes:
      a. Providing openings in miscellaneous metal fabrications to accommodate the Work under this and other Sections, and attaching to miscellaneous metal fabrications all items such as sleeves, bands, studs, fasteners, and all items required for which provision is not specifically included under other Sections.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the Work to be installed with, or attached to, miscellaneous metal fabrications Work.
   2. Hot-dip Galvanizing: Coordinate with steel fabricator detailing for and fabrication of assemblies to be hot-dip galvanized, to minimize distortion during galvanizing process.

C. Related Sections:
   1. Section 03 00 05, Concrete.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ANSI A14.3, Ladders – Fixed –Safety Requirements.
   2. ANSI Z359.1, Safety Requirements for Personal Fall Arrest Systems, Subsystems, and Components.
   3. ASTM A36/A36M, Specification for Carbon Structural Steel.
   4. ASTM A53/A53M, Specification for Pipe Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
   5. ASTM A123/A123M, Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
   6. ASTM A153/A153M, Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
   7. ASTM A240/A240M, Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet and Strip for Pressure Vessels and for General Applications.
   8. ASTM A320/A320M, Specification for Alloy-Steel and Stainless Steel Bolting Materials for Low-Temperature Service.
   9. ASTM A384/A384M Standard Practice for Safeguarding Against Warpage and Distortion During Hot-Dip Galvanizing of Steel Assemblies.
   10. ASTM A500, Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes.
   11. ASTM A572/A572M, Specification for High-Strength Low-Alloy Columbium-Vanadium Structural Steel.
   12. ASTM A793, Specification for Rolled Floor Plate, Stainless Steel.
   13. ASTM A992/A992M, Specification for Structural Steel Shapes.

14. ASTM A1011/A1011M, Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength.
15. ASTM B209, Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
16. ASTM B211, Specification for Aluminum and Aluminum-Alloy Bar, Rod and Wire.
17. ASTM B221, Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
18. ASTM B308/B308M, Specification for Aluminum-Alloy 6061-T6 Standard Structural Profiles.
19. ASTM B429, Specification for Aluminum-Alloy Extruded Structural Pipe and Tube.
20. ASTM B632/B632M, Specification for Aluminum-Alloy Rolled Tread Plate.
21. AWS D1.1/D1.1M, Structural Welding Code – Steel.
22. AWS D1.2/D1.2M, Structural Welding Code – Aluminum.
23. AWS D1.6, Structural Welding Code – Stainless Steel.
24. NAAMM, Metal Finishes Manual.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Welding:
      a. Qualify welding processes and welding operators in accordance with AWS D1.1/D1.1M, D1.2/D1.2M, or D1.6, as applicable.
      b. When requested by ENGINEER, provide certification that each welder employed on or to be employed for the Work have satisfactorily passed AWS qualification tests within previous 12 months. Ensure that all certifications are current.

B. Regulatory Requirements: Conform to the following:
   1. 29 CFR 1910, Occupational Health and Safety Standards.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Fabrication and erection details for assemblies of miscellaneous metal Work. Include plans, elevations, and details of sections and connections. Show anchorage and accessory items. Include setting drawings and templates for locating and installing miscellaneous metal items and anchorage devices.
   2. Product Data:
      a. Copies of manufacturer's specifications, load tables, dimension diagrams, anchor details, and installation instructions for products to be used in miscellaneous metal Work.

B. Informational Submittals: Submit the following:
   1. Test and Evaluation Reports:
      a. Mill test report that indicate chemical and physical properties of each type of material, when requested by ENGINEER.
   2. Qualifications Statements:
      a. Copies of welder's certifications, when requested by ENGINEER.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling and Unloading:
   1. Deliver products to Site to ensure uninterrupted progress of the Work. Deliver anchorage materials to be embedded in other construction in ample time to prevent delaying the Work.

PART 2 PRODUCTS

2.1 MATERIALS

A. Steel:
   1. W-Shapes and WT-Shapes: ASTM A992/A992M.
   2. S-Shapes and Channels: ASTM A572/A572M, Grade 50.
   3. Hollow Structural Sections: ASTM A500, Grade B.
   4. Angles, Plates, Bars: ASTM A36/A36M.
   5. Steel Pipe: ASTM A53/A53M, Grade B.

B. Aluminum:
   1. Aluminum Shapes: ASTM B308/B308M, Alloy 6061-T6, ASTM B 221, Alloy 6061-T6.
   2. Aluminum Tubes and Pipes: ASTM B429, Alloy 6061-T6.
   3. Aluminum Bars and Rod: ASTM B211, Alloy 6061-T6.
   4. Aluminum Plates: ASTM B209, Alloy 6061-T6.

C. Stainless Steel:
   1. Plates and Sheets: ASTM A240/A240M, Type 304L or Type 316 stainless steel.
   2. Submerged or Intermittently Submerged: Type 316 stainless steel.
   3. Non-submerged: Type 304L stainless steel.

D. Stainless Steel Fasteners and Fittings: ASTM A 320/A 320M, Type 304L or Type 316 Stainless Steel.

E. Zinc-coated Hardware: ASTM A153/A153M.

2.2 MISCELLANEOUS METAL ITEMS

A. Shop Assembly:
   1. Pre-assemble items in the shop to the greatest extent possible to minimize field-splicing and field-assembly of units at the Site. Disassemble units only to extent necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Aluminum Ladders:
   1. Fabricate ladders for locations shown or indicated with dimensions, spacing, details, and anchorages as shown and specified. Comply with OSHA 29 CFR 1910 and ANSI A14.3, except as otherwise shown or specified.
      a. Unless otherwise shown, provide 1.5-inch diameter continuous side rails, spaced at least 1.5 feet apart.
      b. Provide extruded square rungs, spaced maximum of 12 inches on centers, with non-slip surface on top of each rung. Adhesive strips for non-slip surfaces are not acceptable.

2. Fit rungs in centerline of side rails, plug weld, and grind smooth on outer rail faces.
3. Support each ladder at top and bottom and at intermediate points spaced not more than five feet on centers.
4. Use welded or bolted brackets, designed for adequate support and anchorage, and to hold ladder clear of wall surface with minimum of seven inches between wall and centerline of rungs.
5. Unless otherwise shown or approved by ENGINEER, extend rails 3.5 feet above top rung, and return rails to wall or structure, unless other secure handholds are provided. If adjacent structure does not extend above top rung, goose-neck extended rails back to structure to provide secure ladder access.
6. Use extruded aluminum conforming to alloy and temper 6061-T6.

C. Shelf Angles:
1. Provide structural steel shelf angles of sizes shown, for attachment to concrete or masonry construction. Provide slotted holes to receive 3/4-inch bolts, spaced not more than six inches from ends and not more than 2.0 feet on centers, unless otherwise shown.
   a. Provide galvanized shelf angles on outdoor construction.
2. Provide wedge-type concrete inserts, complete with fasteners, for attachment of shelf angles to cast-in-place concrete.

D. Aluminum Stair Nosings:
1. Manufacturers: Provide products of one of the following:
   a. Supergrit Type 241BF by Wooster Products, Inc.
   b. Or equal.
2. Fabricate extruded aluminum nosing of sizes and configurations as shown on the Drawings.
   a. Unless otherwise shown, provide ribbed abrasive filled type, using black abrasive filler.
3. Provide anchors for embedding in concrete, either integral or applied to treads, as standard with manufacturer.

E. Bollards:
1. Provide Schedule 80 galvanized steel pipe filled with concrete as shown on the Drawings. Paint as required in accordance with manufacturer's paint standards. Unless otherwise shown or specified, finish-paint bollard "Safety Yellow."

F. Miscellaneous Framing and Supports:
1. Provide miscellaneous metal framing and supports that are not part of structural steel framework and are required to complete the Work.
2. Fabricate miscellaneous units to sizes, shapes, and profiles shown on the Drawings or, if not shown, of required dimensions to receive adjacent grating, plates, tanks, doors, and other work to be retained by the framing.
3. Except as otherwise shown, fabricate from structural shapes, plates, and bars, of all-welded construction using mitered corners, welded brackets, and splice plates and minimum number of joints for field connection.
4. Cut, drill, and tap units to receive hardware and similar items to be anchored to the Work.
5. Furnish units with integrally welded anchors for casting into concrete or building into masonry. Furnish inserts if units are to be installed after concrete is placed.
   a. Except as otherwise shown, space anchors, 2.0 feet on centers, and provide units the equivalent of 1.25-inch by 1/4-inch by eight-inch strips.
   b. Galvanize exterior miscellaneous frames and supports.

c. Where shown or indicated, galvanize miscellaneous frames and supports that are not to be installed outdoors.

6. Miscellaneous steel framing and supports shall be hot-dip galvanized and finish-painted, unless otherwise shown or indicated.
7. Surface preparation and painting of galvanized surface shall conform to manufacturer's painting standards.

G. Fasteners and Hardware: Provide Type 316 stainless steel fasteners for aluminum fabrications and zinc-coated hardware for galvanized fabrications, unless otherwise shown or specified.

2.3 FINISHING

A. Surface Preparation and Shop Priming: Perform surface preparation and apply primer coat to miscellaneous metal fabrications in the shop. Conform surface preparation and shop priming to manufacturer's standards.

B. Galvanizing:
1. Galvanizing of fabricated steel items shall comply with ASTM A123/A123M.
2. Details of fabrication of steel items and assemblies to be hot-dip galvanized shall conform to recommendations of ASTM A384/A384M to minimize the potential for distortion.

C. Aluminum Finish: Provide an Architectural Class 1 anodized finish, AA-M32C22-A41, as specified in NAAMM Metal Finishes Manual. Color of finish shall be as approved by ENGINEER.

2.4 SOURCE QUALITY CONTROL

A. Tests and Inspections:
1. Materials and fabrication procedures shall be subject to inspection and tests in the mill, shop, and field, conducted by a qualified inspection agency. Such inspections and tests will not relieve CONTRACTOR of responsibility for providing materials and fabrication procedures complying with the Contract Documents.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine conditions under which the Work is to be performed and notify ENGINEER in writing of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Install miscellaneous metal fabrications accurately in location, alignment, and elevation, plumb, level, true, and free of rack, measured from established lines and levels. Brace temporarily or anchor temporarily in formwork where fabrications are to be built into concrete, masonry, or other construction.

B. Anchor securely as shown and as required for the intended use, using concealed anchors where possible.

C. Fit exposed connections accurately together to form tight, hairline joints. Field-weld steel connections that are not to be exposed joints and cannot be shop-welded because of shipping size limitations. Comply with AWS D1.1/D1.1M, D1.2/D1.2M and D1.6, as applicable to the material being welded. Grind steel joints smooth and touch-up shop paint coat. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication, and are intended for bolted or screwed field connections.

D. Protection of Aluminum from Dissimilar Materials:
   1. Coat surfaces of aluminum that will contact dissimilar materials such as concrete, masonry, and steel, in accordance with manufacturer's coating standards.

END OF SECTION

SECTION 05 56 00

METAL CASTINGS

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install metal castings.
   2. Castings include metal items that are not part of miscellaneous metal fabrications or metal systems in other Specifications Sections.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before metal castings Work.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASTM A48/A48M, Specification for Gray Iron Castings.
   2. ASTM A126, Specification for Gray Iron Castings for Valves, Flanges, and Pipe Fittings.
   3. ASTM C478, Specification for Precast Reinforced Concrete Manhole Sections.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer: Shall have at least five years experience manufacturing products substantially similar to those required and shall be able to submit documentation of at least five installations in satisfactory operation for at least five years each.

B. Component Supply and Compatibility:
   1. Obtain all frame, lid or cover and grate products included in this Section regardless of component manufacturer, from a single castings manufacturer.
   2. Castings manufacturer shall review and approve or prepare all Shop Drawings and other submittals for all components furnished under this Section.
   3. Components shall be constructed for specified service conditions and shall be integrated into overall assembly by castings manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Fabrication and installation of all casting assemblies. Include plans, elevations, and details of sections and connections. Show anchorage and accessory items. Include setting drawings for location and installation of castings and anchorage devices.
   2. Product Data:

a. Copies of manufacturer's catalog information for the products proposed for use, specifications, load tables, dimension diagrams, anchor details, and installation instructions.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Furnish certification, signed by authorized officer of CONTRACTOR and notarized, stating that all components are furnished by the same manufacturer.
      b. Manufacturer's certification that the casting or lot of castings was made, sampled, tested and inspected in accordance with ASTM A48.
   2. Qualifications Statements: Submit qualifications for the following:
      a. Manufacturer, when required by ENGINEER.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling, and Unloading:
   1. Deliver products to the Site to ensure uninterrupted progress of the Work. Deliver anchorage materials to be embedded in concrete in ample time to prevent delaying the Work.
   2. Comply with Section 01 65 00, Product Delivery Requirements.

B. Storage and Protection:
   1. Protect materials from corrosion and deterioration.
   2. Comply with Section 01 66 00, Product Storage and Handling Requirements.

PART 2 PRODUCTS

2.1 MATERIALS

A. Provide products from the following manufacturers:
   1. Neenah Foundry Company.
   2. EJ (formerly East Jordan Ironworks).
   3. Or equal.

B. Material: ASTM A48/A48M, Class 35 B.

C. Products:
   1. Round Manhole Frame with Solid Lid.
   2. Round Manhole Frame with Solid Bolted Lid.
   3. Round Manhole Frame with Solid Lid – Flush Top.
   4. Catch Basin Frame with Grate.
   5. Curb Inlet Frame Grate and Curb Box.
   6. Valve Box Frame and Lid.

2.2 FABRICATION

A. Fabrication, General:

1. Castings shall be of uniform quality, free of sand holes, gas holes, shrinkage cracks, and other surface defects.
2. Castings shall be ground smooth and well-cleaned by shot blasting in the shop.
3. Design and fabricate round frames and covers to prevent rocking and rattling under traffic loads that will be imposed in actual use.
4. Fabricate castings true to pattern so that component parts fit together.
5. Each casting shall be identifiable and, depending on its size, shall indicate the following: name of producing foundry, ASTM material designation, individual part number, and cast or heat date. Castings shall include all lettering shown or indicated on the Drawings.

PART 3 EXECUTION

3.1 INSPECTION

A. Examine conditions under which Work is to be performed and notify ENGINEER in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with installation until unsatisfactory conditions are corrected.

3.2 INSTALLATION

A. Comply with casting manufacturer's printed instructions and the Contract Documents. Where castings are installed on precast concrete, fabricated fiberglass, or other fabricated products, install casting in accordance with requirements of manufacturer of product on which casting will be installed.

B. Set castings accurately to required location, alignment, and elevation, plumb, level, true and free of rack, measured from established lines and levels. Where applicable, brace temporarily or anchor temporarily in formwork.

END OF SECTION

SECTION 07 92 00

JOINT SEALANTS

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, tools, equipment, and incidentals as shown, specified, and required to furnish and install joint sealants.
   2. Extent of each type of calking and sealant is shown or indicated and includes the following:
      a. Interior and exterior joints in equipment and construction systems not filled by another material, and that are not required to be open for operation.
      b. Exposed-to-view joints of all fire-rated sealants.
      c. Joints specified to be recalked.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate installation of items to be installed with or before joint sealants.
   2. Coordinate final selection of joint sealants so that materials are compatible with all calking and sealant substrates specified.

C. Related Sections:
   1. Section 03 00 05, Concrete.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASTM C510, Test Method for Staining and Color Change of Single- or Multicomponent Joint Sealants.
   2. ASTM C661, Test Method for Indentation Hardness of Elastomeric-Type Sealants by Means of a Durometer.
   3. ASTM C793, Test Method for Effects of Accelerated Weathering on Elastomeric Joint Sealants.
   4. ASTM C794, Test Method for Adhesion-in-Peel of Elastomeric Joint Sealants.
   5. ASTM C920, Specification for Elastomeric Joint Sealants.
   6. ASTM C1021, Practice for Laboratories Engaged in Testing Building Sealants.
   7. ASTM C1087, Test method for Determining Compatibility of Liquid-Applied Sealants with Accessories Used in Structural Glazing Systems.
   8. ASTM C1193, Guide for Use of Joint Sealants.
   9. ASTM C1247, Practice for Durability of Sealants Exposed to Continuous Immersion in Liquids.
   10. BAAQMD Regulation 8, Rule 51.
   11. FS TT-S-00227, Sealing Compound: Elastomeric Type, Multi-component (for Calking, Sealing, and Glazing in Buildings and Other Structures).
   12. FS TT-S-00230 Sealing Compound: Elastomeric Type, Single Component (for Calking, Sealing, and Glazing in Buildings and Other Structures).
   13. NSF/ANSI Standard 61, Drinking Water System Components - Health Effects.
   14. SCAQMD Rule 1168.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Installer:
      a. Engage a single installer, approved by product manufacturer, regularly engaged in calking and sealant installation and with successful experience in applying types of products required, and who employs only tradesmen with specific skill and successful experience in the type of Work required.
   2. Testing Laboratory:
      a. Furnish services of independent testing laboratory qualified according to ASTM C1021, for conducting testing required.

B. Component Supply and Compatibility:
   1. Obtain materials only from manufacturers who will, if required:
      a. Test joint sealants for compatibility with substrates for conformance with FS-TT-S-00227, and recommend remedial procedures as required.
   2. Before purchasing each sealant, investigate its compatibility with joint surfaces, joint fillers, and other materials in joint system. Provide products that are fully compatible with actual installation condition, verified by manufacturer's published data or certification, and as shown on approved Shop Drawings and other approved submittals.

C. Product Testing: Provide test results of laboratory pre-construction compatibility and adhesion testing, as specified in Article 3.1 of this Section, by qualified testing laboratory, based on testing of current sealant formulations within a 36-month period preceding the Notice to Proceed for the Work.
   1. Test elastomeric joint sealants for compliance with requirements specified by reference to ASTM C920 and, where applicable, to other standard test methods.
   2. Test other joint sealants for compliance using specified post-construction field adhesion test.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Schedule of joint sealants installation, indication each specific surface where calking or sealants are to be provided and the material proposed for each application.
   2. Product Data:
      a. Copies of manufacturer's data sheets including color charts, specifications, recommendations, and installation instructions for each type of sealant, calking compound, and associated miscellaneous material required. Include manufacturer's published data, indicating that each product complies with the Contract Documents and is intended for the applications shown or indicated.
      b. Product test reports.
   3. Samples:
      a. Each type of actual cured material of each calking and sealant specified, in each of manufacturer's standard colors.
      b. Samples will be reviewed by ENGINEER for color and texture only. Compliance with other requirements is responsibility of CONTRACTOR.

B. Informational Submittals: Submit the following:
   1. Certificates:

a. Certify that materials are suitable for intended use and materials meet or exceed requirements of the Contract Documents.
b. Certification from manufacturer that products furnished are appropriate for surfaces and conditions to which they will be applied.
c. Certify that applicator is approved by manufacturer.

2. Field Quality Control Submittals:
   a. Results of tests on job mock-ups.
   b. Pre-construction and post-construction field test reports.
   c. Compatibility and adhesion test reports.
   d. Contractor's Field Test Report Logs:
      1) Indicate time present at the Site.
      2) Include observations and results of field tests, and document compliance with manufacturer's installation instructions and supplemental instructions provided to installers.
3. Qualifications: Submit qualifications for:
   a. Installer.
   b. Testing laboratory (if not already submitted under Section 01 45 29, Testing Laboratory Services).

C. Closeout Submittals: Submit the following:
1. Operation and Maintenance Data:
   a. Recommended inspection intervals.
   b. Instructions for repairing and replacing failed sealant joints.
2. Warranty: Submit written warranties as specified in this Section.

1.5 DELIVERY, STORAGE AND HANDLING

A. Comply with Section 01 65 00, Product Delivery Requirements, and Section 01 66 00, Product Storage and Handling Requirements, and the following:
1. Delivery of Products:
   a. Deliver products in calking and sealant manufacturer's original unopened, undamaged containers, indicating compliance with approved Shop Drawings and approved Sample color selections.
   b. Include the following information on label:
      1) Name of material and Supplier.
      2) Formula or Specification Section number, lot number, color and date of manufacture.
      3) Mixing instructions, shelf life, and curing time, when applicable.
2. Storage of Products:
   a. Do not store or expose materials to temperature above 90 degrees F or store in direct sunlight.
   b. Do not use materials that are outdated as indicated by shelf life.
   c. Store sealant tape in manner that will not deform tape.
   d. In cool or cold weather, store containers for sixteen hours before using in temperature of approximately 75 degrees F.
   e. When high temperatures prevail, store mixed sealants in a cool place.
3. Handling:
   a. Do not open containers or mix components until necessary preparatory Work and priming are complete.

1.6 JOB CONDITIONS

A. Environmental Conditions:
   1. Do not install joint sealants under adverse weather conditions, or when temperatures are below or above manufacturer's recommended limitations for installation.
   2. Proceed with the Work when forecasted weather conditions are favorable for proper cure and development of high-early bond strength.
   3. Where joint width is affected by ambient temperature variations, install elastomeric sealants when temperatures are in the lower third of manufacturer's recommended installation temperature range, so that sealant will not be subjected to excessive elongation and bond stress at subsequent low temperatures.
   4. When high temperatures prevail, avoid mixing sealants in direct sunlight.
   5. Supplemental heat sources required to maintain both ambient and surface temperatures within the range recommended by manufacturer for material applications are not available at the Site.
   6. Provide supplemental heat and energy sources, power, equipment, and operating, maintenance, and temperature monitoring personnel.
   7. Do not use heat sources that emit carbon dioxide or carbon monoxide into areas of calking, sealants, and painting Work, and areas where OWNER's personnel or construction personnel may work. Properly locate and vent such heat sources to outdoors so that joint sealants and other Work are unaffected by exhaust.

1.7 WARRANTY

A. Provide written warranty, signed by manufacturer and CONTRACTOR, agreeing to repair or replace sealants that fail to perform as air-tight and watertight joints; or fail in joint adhesion, cohesion, abrasion resistance, weather resistance, extrusion resistance, migration resistance, stain resistance, or general durability; or appear to deteriorate in any other manner not clearly specified in approved Shop Drawings and other submittals, as an inherent quality of material for exposure indicated.
   1. Provide manufacturer warranty for period of one year from date of Substantial Completion of joint sealants Work.
   2. Provide installer warranty for period of two years from date of Substantial Completion of joint sealants Work.

PART 2 PRODUCTS

2.1 SYSTEM PERFORMANCE

A. Provide elastomeric joint sealants for interior and exterior joint applications that establish and maintain watertight and airtight continuous joint seals without staining or deteriorating joint substrates.

B. VOC Performance Criteria:
   1. VOC content of sealants used shall comply with current VOC content limits of SCAQMD Rule 1168. Sealants used as fillers shall comply with or exceed requirements of BAAQMD Regulation 8, Rule 51.
      a. Sealants: 250 g/L.
      b. Sealant Primers for Nonporous Substrates: 250 g/L.
      c. Sealant Primers for Porous Substrates: 775 g/L.

C. Provide colors selected by ENGINEER from calking and sealant manufacturer's standard and custom color charts. "Or equal" manufacturers shall provide same generic products and colors as available from manufacturers specified.

2.2 MATERIALS

A. Exterior and Interior Horizontal and Vertical Joints; Submerged and Intermittently Submerged in Potable Water or Water That Will be Treated to Become Potable:
   1. Two-component Polyurethane Sealant:
      a. Products and Manufacturers: Provide one of the following:
         1) Sikaflex- 2c NS by Sika Corporation.
         2) Or equal.
      b. Two-component, moisture cured, gun grade, polyurethane sealant, complying with:
         1) FS TT-S-00227E, Type II, Class A; ASTM C920, Type M, Grade NS, Class 25.
         2) Adhesion-in-Peel, FS TT-S-00227E, ASTM C794 (Minimum five pounds per linear inch with no adhesion failure): 18 pounds.
         3) Hardness (Standard Conditions), ASTM C661: 25 (Shore A).
         4) Stain and Color Change, FS TT-S-00227E and ASTM C510: No discoloration or stain.
         5) Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weatherometer.
         6) Rheological Vertical Displacement at 120 degrees F, FS TT-S-00227E: No sag.
         7) VOC Content: 220 g/L, maximum.
         8) Listed in NSF/ANSI 61

B. Exterior and Interior Horizontal and Vertical Joints; Submerged and Intermittently Submerged in Wastewater:
   1. Two-component Polyurethane Sealant:
      a. Products and Manufacturers: Provide one of the following:
         1) Sikaflex- 2c NS by Sika Corporation.
         2) Vulkem 227 by Tremco Sealant/Waterproofing Division of RPM International, Inc.
         3) Or equal.
      b. Polyurethane based, two-component elastomeric sealant complying with:
         1) FS TT-S-00227E: Type II (non-sag) Class A and ASTM C920, Type M, Grade NS, Class 25.
         2) Adhesion-in-Peel, FS TT-S-00227E and ASTM C794: (Minimum five pounds per linear inch with no adhesion failure): 18 lbs.
         3) Hardness (Standard Conditions), ASTM C661: 25 (Shore A).
         4) Stain and color change, FS TT-S-00227E and ASTM C510: No discoloration or stain.
         5) Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weatherometer.
         6) Rheological Vertical Displacement at 120 degrees F, FS TT-S-00227E: No sag.
         7) VOC Content: 220 grams per liter, maximum.

C. Exterior and Interior Vertical Joints; Non-submerged:
   1. Two-component Polyurethane Sealant:
      a. Products and Manufacturers: Provide one of the following:
         1) Sikaflex- 2c NS by Sika Corporation.
         2) Dymeric 240 FC by Tremco Sealant/Waterproofing Division of RPM International, Inc.

3) Or equal.

b. Polyurethane based, two-component elastomeric sealant complying with:
   1) FS TT-S-00227E: Type II (non-sag) Class A and ASTM C920, Type M, Grade NS, Class 25.
   2) Adhesion-in-Peel, FS TT-S-00227E and ASTM C794: (Minimum five pounds per linear inch with no adhesion failure): 10 pounds.
   3) Hardness (Standard Conditions), ASTM C661: 25 to 35 (Shore A).
   4) Stain and color change, FS TT-S-00227E and ASTM C510: No discoloration or stain.
   5) Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weatherometer.
   6) Rheological Vertical Displacement at 120 degrees F, FS TT-S-00227E: No sag.
   7) VOC Content: 100 g/L, maximum.

D. Exterior and Interior Horizontal Joints; Non-submerged:
   1. Two-component Polyurethane Sealant:
      a. Products and Manufacturers: Provide one of the following:
         1) Sikaflex- 2c SL by Sika Corporation.
         2) THC/900 by Tremco Sealant/Waterproofing Division of RPM International, Inc.
         3) Or equal.
      b. Polyurethane based, two-component elastomeric, self-leveling sealant complying with the following:
         1) FS TT-S-00227E, Type I (self-leveling) Class A. and ASTM C920, Type M, Grade P, Class 25
         2) Water Immersion Bond, FS TT-S-00227E: Elongation of 50 percent with no adhesive failure.
         3) Hardness (Standard Conditions), ASTM C661: 35 to 45.
         4) Stain and Color Change, FS TT-S-00227E and ASTM C510: No discoloration or stain.
         5) Accelerated Aging, ASTM C793: No change in sealant characteristics after 250 hours in weatherometer.
         6) VOC Content: 165 g/L, maximum.

E. Miscellaneous Materials:
   1. Joint Cleaner: As recommended by calking and sealant manufacturer.
   2. Joint Primer and Sealer: As recommended for compatibility with calking and sealant by calking and sealant manufacturer.
   3. Bond Breaker Type: Polyethylene tape or other plastic tape as recommended for compatibility with calking and sealant by calking and sealant manufacturer, to be applied to sealant-contact surfaces where bond to substrate or joint filler must be avoided for proper performance of calking and sealant. Provide self-adhesive tape where applicable.
   4. Sealant Backer Rod: Compressible rod stock polyethylene foam, polyethylene jacketed polyurethane foam, butyl rubber foam, neoprene foam or other flexible, permanent, durable nonabsorptive material as recommended for compatibility with calking and sealant by calking and sealant manufacturer. Provide size and shape of rod that will control joint depth for sealant placement, break bond of sealant at bottom of joint, form optimum shape of sealant bead on back side, and provide highly-compressible backer to minimize possibility of sealant extrusion when joint is compressed.
   5. Low-temperature Catalyst: As recommended by calking and sealant manufacturer.

PART 3 EXECUTION

3.1 INSPECTION

A. Examine joint surfaces, substrates, backing, and anchorage of units forming sealant rabbet, and conditions under which calking and sealant Work will be performed, and notify ENGINEER in writing of conditions detrimental to proper and timely completion of the Work and performance of sealants. Do not proceed with calking and sealant Work until unsatisfactory conditions are corrected.

3.2 PREPARATION

A. Protection: Do not allow joint sealants to overflow or spill onto adjoining surfaces, or to migrate into voids of adjoining surfaces including rough textured materials. Use masking tape or other precautionary devices to prevent staining of adjoining surfaces, by either the primer/sealer or calking and sealant materials.

B. Joint Surface Preparation:
   1. Clean joint surfaces immediately before installing sealant compound. Remove dirt, weakly adhering coatings, moisture and other substances that would interfere with bonds of sealant compound as recommended in sealant manufacturer's written instructions as shown on approved Shop Drawings.
   2. If necessary, clean porous materials by grinding, sandblasting, or mechanical abrading. Blow out joints with oil-free compressed air or by vacuuming joints prior to applying primer or sealant.
   3. Roughen joint surfaces on vitreous coated and similar non-porous materials, when sealant manufacturer's data indicates lower bond strength than for porous surfaces. Rub with fine abrasive cloth or steel wool to produce a dull sheen.
   4. Concrete Joint Preparation: Refer to Section 03 00 05, Concrete.

C. Mixing:
   1. Comply with sealant manufacturer's written instructions for mixing multi-component sealants.
   2. Thoroughly mix components before use.
   3. Add entire contents of activator can to base container. Do not mix partial units.
   4. Mix contents for minimum of five minutes or as recommended by sealant manufacturer, until color and consistency are uniform.

3.3 INSTALLATION

A. Install joint sealants after adjacent areas have been cleaned and before joint has been cleaned and primed, to ensure calking and sealant joints will not be soiled. Replace calking and sealant joints soiled after installation.

B. Comply with sealant manufacturer's written instructions except where more stringent requirements are shown or indicated in the Contract Documents.

C. Prime or seal joint surfaces as shown on approved Shop Drawings and approved other submittals. Do not allow primer or sealer to spill or migrate onto adjoining surfaces. Allow primer to dry prior to applying sealants.

D. Apply masking tape before installing primer, in continuous strips in alignment with joint edge to produce sharp, clean interface with adjoining materials. Remove tape immediately after joints have been sealed and tooled as directed.

E. Confirm that compressible filler is installed before installing sealants.

F. Do not install sealants without backer rods and bond breaker tape.

G. Roll back-up rod stock into joint to avoid lengthwise stretching. Do not twist, braid, puncture, or prime backer rods.

H. Employ only proven installation techniques that will ensure that sealants are deposited in uniform, continuous ribbons without gaps or air pockets, with complete "wetting" of joint bond surfaces equally on opposite sides. Except as otherwise indicated, fill sealant rabbet to a slightly concave surface slightly below adjoining surfaces. Where horizontal joints are between a horizontal surface and a vertical surface, fill joint to form a slight cove, so that joint will not trap moisture and dirt.

I. Install sealants to depths recommended by sealant manufacturer but within the following general limitations, measured at the center (thin) section of bead.
   1. For horizontal joints in sidewalks, pavements, and similar locations sealed with elastomeric sealants and subject to traffic and other abrasion and indentation exposures, fill joints to depth equal to 75 percent of joint width, but not more than 5/8-inch deep or less than 3/8-inch deep.
   2. For vertical joints subjected to normal movement and sealed with elastomeric sealants and not subject to traffic, fill joints to a depth equal to 50 percent of joint width, but not more than 1/2-inch deep or less than 1/4-inch deep.

J. Remove excess and spillage of compounds promptly as the Work progresses.

K. Cure calking and sealant compounds in compliance with manufacturer's instructions and recommendations, to obtain high-early bond strength, internal cohesive strength, and surface durability.

3.4 EXISTING JOINTS

A. Mechanically remove existing sealant and backer rod.

B. Clean joint surfaces of residual sealant and other contaminates capable of affecting sealant bond to joint surface.

C. Conduct laboratory pre-construction compatibility and adhesion testing on joint surfaces in accordance with Part 3 of this Section.

D. Allow joint surfaces to dry before installing new sealants.

3.5 FIELD QUALITY CONTROL

A. Water Leak Testing: Field test for water leaks as follows:
   1. Flood the joint exposure with water directed from a 3/4-inch diameter garden hose, without nozzle, held perpendicular to wall face, two feet from joint and connected to water system

with 30 psi minimum normal water pressure. Move stream of water along joint at an approximate rate of 20 feet per minute.

2. Test approximately five percent of total joint system, in locations that are typical of every joint condition, and that can be inspected easily for leakage on opposite face. Conduct test in presence of ENGINEER, who will determine actual percentage of joints to be tested and actual period of exposure to water from hose, based on extent of observed leakage or lack of observed leakage.
3. Where nature of observed leaks indicates potential of inadequate joint bond strength, ENGINEER may direct that additional testing be performed at a time when joints are fully cured, and before Substantial Completion.

3.6 ADJUSTING AND CLEANING

A. Where leaks and lack of adhesion are evident, replace sealant.

B. Clean adjacent surfaces of sealant and soiling resulting from the Work. Use solvent or cleaning agent recommended by sealant manufacturer. Leave all finish Work in neat, clean condition.

C. Protect sealants during construction so that they will be without deterioration, soiling, or damage at time of readiness for final payment of the Contract.

3.7 PROTECTION

A. During and after curing period, protect joint sealants from contact with contaminating substances and from damage resulting from construction operations or other causes, so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so installations with repaired areas are indistinguishable from original Work.

END OF SECTION

SECTION 31 11 00

CLEARING AND GRUBBING

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals required to perform clearing and grubbing as shown and specified in the Contract Documents.
   2. The Work includes removing from the Site and disposing of trees, stumps, brush, roots, shrubs, vegetation, logs, rubbish, and other objectionable material.
   3. Pay all costs associated with transporting and disposing of debris resulting from clearing.
   4. Limits of Clearing and Grubbing: Clear and grub the areas shown or indicated on the Drawings.

B. Related Sections and Details:
   1. Section 02 41 00, Demolition.
   2. York County Engineering Standards 16-series Standard Details.

1.2 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Comply with Laws and regulations for environmental requirements, disposal of debris, burning debris on Site, and use of herbicides.
   2. Coordinate clearing work with York County and other authorities having jurisdiction, including Utility providers.

1.3 SUBMITTALS

A. Action Submittals: Submit the following
   1. Shop Drawings:
      a. Plan for removing trees and other large vegetation not explicitly shown or indicated for removal in the Contract Documents.
      b. Plan showing proposed limits of clearing and grubbing, if different from clearing and grubbing limits shown or indicated in the Contract Documents.

1.4 WARRANTY

A. CONTRACTOR shall warrant that Work performed under this Section will not permanently damage trees, shrubs, turf, and plants designated to remain, or other adjacent work, facilities, or property. If damage resulting from CONTRACTOR's operations becomes evident during the correction period, CONTRACTOR shall replace damaged items and property at no additional cost to OWNER.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 PREPARATION

A. Protection:
   1. Throughout the Project, protect existing site improvements, including streets, drives, and Underground Facilities to remain (if any), and adjacent property and structures. Repair damage caused by CONTRACTOR to original condition or replace in kind, to satisfaction of ENGINEER, at no additional cost to OWNER.
   2. Protect trees, shrubs, vegetation, and grassed areas to remain by providing temporary fencing, barricades, wrapping, or other methods shown, specified, or accepted by ENGINEER. Correct at CONTRACTOR's expense damage caused by CONTRACTOR outside the limits of clearing Work.
   3. Do not remove trees without approval of ENGINEER, unless shown or indicated for removal.
   4. Do not locate construction equipment, stored materials, or stockpiles within drip line of trees and vegetation to remain.

B. Site Preparation:
   1. Obtain, pay costs associated with, and comply with applicable permits required for clearing and grubbing Work. Do not begin clearing and grubbing Work to acquiring all applicable permits.
   2. Delineation of Clearing and Grubbing Limits:
      a. Locate and clearly flag trees and vegetation to remain, and other materials to remain in the clearing and grubbing limits. Locate and clearly flag salvable vegetation to be relocated.
      b. Provide flagging to delineate limits of areas to be cleared or grubbed. Review at Site with ENGINEER before commencing removal of trees, vegetation, and other materials to be removed.
      c. Replace flagging that is lost, removed, or destroyed, until clearing and grubbing Work is complete and ENGINEER allows removal of flagging.
   3. Erosion and Sediment Controls:
      a. Provide applicable erosion and sediment controls before commencing clearing and grubbing Work.
      b. Comply with York County Engineering Standards 16-series Standard Details and related Standard Details and erosion control requirements and rules and regulations.
      c. Continue providing erosion and sediment controls as clearing and grubbing Work progresses to previously uncleared, ungrubbed areas of the Site.

3.2 CLEARING AND GRUBBING

A. Clearing and grubbing shall be performed along the project at the locations designated on the drawings or as directed by the Engineer.

B. Conduct operations in a manner so as to prevent limb, bark, or root injuries to trees, shrubs, or other types of vegetation that are to remain growing and also to prevent damage to adjacent property.

C. Exercise extreme caution in order not to clear and grub areas outside of the construction right-of-way.

D. Remove and dispose of all trees not reserved by the property owner, shrubs, stumps, roots, brush, tree laps, logs, rubbish, undergrowth, and debris within limits of clearing and grubbing shown or indicated in the Contract Documents, unless otherwise shown or indicated.

E. Any areas of growth or individual trees which are to be preserved due to their desirability for landscape or erosion control purposes will be designated on the drawings or by the ENGINEER.

F. Maintenance of cleared and grubbed areas include:
   1. Clean-up of overgrown areas.
   2. Continuous weeding, brush cutting, and pruning for all areas within the contract site that has been cleared and/or grubbed. This shall take place from the Notice to Proceed until the final approval of the contract. This work is to be accomplished regardless of the phase of work in progress or any delays caused by weather, utilities, or property acquisitions.
   3. CONTRACTOR is to provide for bush-hogging or weed-eating certain areas within the public access or easements that have become overgrown as directed by the ENGINEER. This includes any staging areas being used by the CONTRACTOR for the duration of the contract.

G. Trees and Shrubs Improperly Destroyed or Damaged:
   1. For each tree or shrub to remain that is destroyed or damaged beyond repair by CONTRACTOR, provide two replacements of the same species at locations to be designated by ENGINEER.

H. Trees and shrubs to remain that have been damaged or require trimming shall be protected, treated and repaired under the direction of a qualified arborist, or other professional with qualifications acceptable to ENGINEER.

I. Salvable Vegetation:
   1. Trees, shrubs, and other vegetation requiring removal to facilitate the Work, and that will be transplanted elsewhere at the Site, shall be carefully balled and burlapped or placed in temporary pots, and stored at the Site in an acceptable area. Work involving removing and relocating trees, shrubs, and other vegetation shall be under the direction of qualified arborist acceptable to ENGINEER, or other professional acceptable to ENGINEER, hired by CONTRACTOR.

J. Disposal of Cleared and Grubbed Materials:
   1. Dispose at appropriate off-Site location trees, stumps, rubbish, debris, and other cleared and grubbed material. Cleared or grubbed materials may remain at the Site only when allowed in the Contract Documents or when approved by ENGINEER in writing. Do not use cleared or grubbed material as fill, backfill, or in embankments.
   2. Dispose of cleared and grubbed material in accordance with Laws and Regulations.
   3. Do not burn clearing debris at the Site, unless approved by OWNER and authorities having jurisdiction. If burning is permitted, comply with requirements of authorities

having jurisdiction and Laws and Regulations. If burning is permitted at the Site, also comply with OWNER's requirements.

K. Removal of Site Improvements: Comply with Section 02 41 00, Demolition.

3.3 TOPSOIL REMOVAL

A. Existing topsoil to be removed is defined as friable, clay loam, surface soil present in depth of at least four inches. Topsoil shall be free of subsoil, clay lumps, stones, and other objects over two-inch diameter and other objectionable material.

B. Stripping:
   1. Strip topsoil to depths encountered, in manner that prevents intermingling of topsoil with underlying subsoil or other objectionable material. Remove heavy growths of grass and vegetation from areas before stripping.
   2. Do not strip topsoil from within drip line of each tree to remain as part of the completed Project.

C. Stockpile topsoil in storage stockpiles in areas shown, or where otherwise accepted by ENGINEER. Construct storage piles so that surface water drains freely. Stabilize large topsoil piles with a cover crop and mulch, and provide silt fencing around perimeter of pile to prevent topsoil erosion and sedimentation; silt fencing shall be in accordance with York County Engineering Standard Details 16.03 and 16.03A and rules and regulations. Cover smaller topsoil stockpiles, when used, with reinforced fabric to prevent windblown dust. Topsoil in excess of the quantity required for the finished Project shall remain property of OWNER.

3.4 ENVIRONMENTAL PROTECTION AND RESTORATION

A. South Carolina Department of Health and Environmental Control.

B. South Carolina Department of Natural Resources.

C. US Army Corps of Engineers.

D. US Department of the Interior.

E. York County Environmental Compliance or local Authority Having Jurisdiction.

END OF SECTION

SECTION 31 23 05

EXCAVATION AND FILL

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. CONTRACTOR shall provide all labor, materials, equipment, and incidentals required to perform all excavating, filling, and grading, and disposing of earth materials as shown, specified, and required for construction of structures, Underground Facilities, roads, and other facilities required to complete the Work.
   2. Preparation of subgrade for slabs and pavements is included under this Section.
   3. No classification of excavated materials will be made. Excavation includes all materials regardless of type, character, composition, moisture, or condition thereof, except rock requiring drilling, blasting or special equipment for removal which is under Section 31 23 16.26, Rock Removal.

B. Related Sections:
   1. Section 03 30 05, Concrete.
   2. Section 31 23 16.26, Rock Removal.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ACI 522R, Pervious Concrete.
   2. ANSI/AISC 360, Specification for Structural Steel for Buildings.
   3. ASTM C29/C29M, Test Method for Bulk Density (“Unit Weight”) and Voids in Aggregate.
   4. ASTM C33/C33M, Specification for Concrete Aggregates.
   5. ASTM C94/C94M, Specification for Ready-Mixed Concrete.
   6. ASTM C138/C138M, Test Method for Density (Unit Weight), Yield, and Air Content (Gravimetric) of Concrete.
   7. ASTM C172, Practice for Sampling Freshly Mixed Concrete.
   8. ASTM C150/C150M, Specification for Portland Cement.
   9. ASTM C595/C595M, Specification for Blended Hydraulic Cements.
   10. ASTM C618, Specification for Coal Fly Ash and Raw or Calcined Natural Pozzolan for Use in Concrete.
   11. ASTM C989, Specification for Slag Cement for Use in Concrete and Mortars.
   12. ASTM D422, Test Method for Particle-Size Analysis of Soils.
   13. ASTM D448, Classification for Sizes of Aggregate for Road and Bridge Construction.
   14. ASTM D698, Test Methods for Laboratory Compaction Characteristics of Soil Using Standard Effort (12 400 ft-lbf/ft^3 (600 kN-m/m^3)).
   15. ASTM D1556, Test Method for Density and Unit Weight of Soil in Place by the Sand-Cone Method.
   16. ASTM D1557, Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft^3 (2,700 kN-m/m^3)).
   17. ASTM D2216, Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass.

18. ASTM D4253, Test Methods for Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.
19. ASTM D4254, Test Methods for Minimum Index Density and Unit Weight of Soils and Calculation of Relative Density.
20. ASTM D4318, Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils.
21. ASTM D4832, Test Method for Preparation and Testing of Controlled Low Strength Material (CLSM) Test Cylinders.
22. ASTM D6023, Test Method for Density (Unit Weight), Yield, Cement Content, and Air Content (Gravimetric) of Controlled Low-Strength Material (CLSM).
23. ASTM D6103, Test Method for Flow Consistency of Controlled Low Strength Material (CLSM).
24. ASTM D6938, Test Method for In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth).
25. ASTM E329, Specification for Agencies Engaged in Construction Inspection and/or Testing.
26. South Carolina Department of Transportation Qualified Products Listings and Policies for Construction and Maintenance Materials.
27. Work Area Traffic Control Handbook (WATCH).
28. York County Ordinance 154.110.

1.3 TERMINOLOGY

A. The following words or terms are not defined but, when used in this Section, have the following meaning:
   1. “Subgrade” is the uppermost surface of native soil material unmoved from cuts; the bottom of excavation.

1.4 QUALITY ASSURANCE

A. Qualifications:
   1. Professional Engineer:
      a. Engage a registered professional engineer legally qualified to practice in the same jurisdiction as the Site and experienced in providing engineering services of the kind indicated.
      b. Responsibilities include but are not necessarily limited to:
         1) Reviewing system performance and requirements shown or indicated in the Contract Documents.
         2) Preparing written requests for clarifications or interpretations of performance and requirements for submittal to ENGINEER by CONTRACTOR.
         3) Preparing or supervising the preparation of design calculations and related submittals verifying compliance of the system with the requirements of the Contract Documents.
         4) Signing and sealing all calculations, drawings, and submittals prepared by professional engineer.
         5) Certifying that:
            a) it has performed the design of the system in accordance with the performance requirements stated in the Contract Documents, and
            b) the said design conforms to Laws and Regulations, and to the prevailing standards of practice.

B. Quality Assurance Testing:
   1. OWNER typically retains 3rd party for Quality Control testing on capital projects. Specific Quality Assurance Testing requirements and procedures shall be established on a Project-by-Project basis.
   2. Materials used in the Work may require testing and retesting, as directed by ENGINEER, during the Project. Allow free access to material stockpiles and facilities at all times. Tests, including retesting of rejected materials and installed Work, shall be performed by OWNER and at OWNER'S expense.

C. Regulatory Requirements:
   1. Perform excavation work in compliance with requirements of authorities having jurisdiction and Laws and Regulations, including:
      a. OSHA, 29 CFR Part 1926, Section .650 (Subpart P – Excavations).
   2. Obtain required permits and approvals for excavation and fill Work, including work permits from right-of-way owners and permits from environmental authorities having jurisdiction over discharge of water from excavations.

1.5 SUBMITTALS

A. Informational Submittals: Submit the following:
   1. Procedure Submittals:
      a. Excavation Plan: Prior to starting excavation operations, submit written plan to demonstrate compliance with OSHA 29 CFR Part 1926.650. As a minimum, excavation plan shall include:
         1) Name of CONTRACTOR's "competent person" in responsible charge of excavation and fill Work.
         2) Excavation method(s) and additional items to be included in the Work, as listed in Paragraph 1.5.A.2.a of this Section.
         3) Copies of "manufacturer's data" or other tabulated data if protective system(s) are designed on the basis of such data.
         4) Copies of required permits and approvals, from authorities having jurisdiction and affected utility owners, for excavation methods proposed.
      b. Proposed compaction procedure and compaction equipment proposed for use. Where different procedures or equipment will be used for compacting different types of material or at different locations at the Site, indicate where each procedure and equipment item will be used.
   2. Excavation Support Plan and Related Information Prepared by CONTRACTOR's Professional Engineer:
      a. CONTRACTOR and CONTRACTOR's professional engineer shall prepare the following for submittal:
         1) Sheeting and bracing, or other protective system(s) required.
         2) Dewatering system.
         3) Cofferdams.
         4) Underpinning.
      b. Drawings and calculations shall be prepared by professional engineer qualified in the specialty involved. ENGINEER's review and acceptance of submittal does not imply approval by ENGINEER of the associated Work. CONTRACTOR shall be solely responsible for designing, installing, operating and maintaining the system(s) required to satisfactorily perform all necessary sheeting, bracing, protection, underpinning, and dewatering.

3. Delivery Tickets:
    a. Copy of delivery ticket for each load of aggregate and borrow material delivered to the Site. Each delivery ticket shall indicate project and contract by name and number, date, material type, department of transportation item number when applicable, and quantity delivered.
4. Quality Assurance Test Results Submittals:
    a. Submit results of quality assurance testing performed by in accordance with Paragraph 1.4.B of this Section, unless included as part of another submittal under this Section. Submit results for the following quality assurance testing:
        1) Tests on borrow fill material.
        2) Optimum moisture – maximum dry density curve for each type of fill material.
5. Qualifications Statements:
    a. Professional engineer.

1.6 SITE CONDITIONS

A. Subsurface Information: The Project Manual indicates information available relative to subsurface conditions at the Site. Such information and data is not intended as a representation or warranty of continuity of conditions between soil borings or test pits, nor of groundwater levels at dates and times other than date and time when measured, nor that purpose of obtaining the information and data were appropriate for use by CONTRACTOR. OWNER will not be responsible for interpretations or conclusions drawn therefrom by CONTRACTOR.

B. Soil borings and other exploratory operations may be made by CONTRACTOR, at no additional cost to OWNER. Coordinate CONTRACTOR-performed test borings and other exploratory operations with OWNER and utility owners as appropriate. Perform such explorations without disrupting or otherwise adversely affecting operations of OWNER or utility owners. Comply with Laws and Regulations relative to required notifications.

C. Existing Structures:
1. The Contract Documents show or indicate certain structures and Underground Facilities adjacent to the Work. Such information was obtained from existing records and is not guaranteed to be correct or complete. CONTRACTOR shall explore ahead of the excavation to determine the exact location of all existing structures and Underground Facilities. Existing structures and Underground Facilities shall be supported and protected from damage by CONTRACTOR. Immediately repair and restore existing structures and Underground Facilities damaged by CONTRACTOR without additional cost to OWNER.
2. Movement or operation of construction equipment over Underground Facilities shall be at CONTRACTOR's sole risk and only after CONTRACTOR has prepared and submitted to ENGINEER and utility owners (as applicable), and received acceptance therefrom, a plan describing CONTRACTOR's analysis of the loads to be imparted and CONTRACTOR's proposed measures to protect structures and Underground Facilities during the Project.
3. Coordinate with utility owners for shut-off of services in active piping and conduits. When required by utility owner, OWNER will assist CONTRACTOR with utility owner notifications. Completely remove buried piping and conduits indicated for removal and not otherwise indicated as being abandoned or to remain in place.

4. In general, service lines and laterals to individual houses and businesses are not shown; however, CONTRACTOR shall assume that a service exists for each utility owner to each house, business, and property.
5. Do not interrupt existing utilities serving facilities occupied and used by OWNER or others, except when such interruption is indicated in the Contract Documents or when allowed in writing by ENGINEER after acceptable temporary utility services are provided by CONTRACTOR for the affected structure or property.

PART 2 PRODUCTS

2.1 MATERIALS

A. Select Fill:
   1. Material shall be well-graded, crushed aggregate, free of organic material. Material shall be Coarse Aggregate No. 57 in accordance with the Coarse Aggregate Gradation Table in the appendix of the SCDOT Standard Specifications for Highway Construction.

B. General Fill:
   1. Material shall be free of: roots, vegetative matter, waste, construction material, rock larger than ¾ cubic foot, debris, waste, frozen materials, organic material, and other deleterious matter. Small rock shall not exceed 10% of the fill material.
   2. Fill shall have a liquid limit not greater than 45, and plasticity index not greater than 25, or as directed by ENGINEER.
   3. Previously-excavated materials complying with the Contract Documents requirements for general fill may be used for general fill.
   4. When on-Site materials are found unsuitable for use as general fill, provide select fill or approved off-Site general fill materials. Prior to using off-Site material as general fill, furnish submittal for and obtain ENGINEER's approval of the material proposed for use.

C. Subbase Material:
   1. Material shall be naturally- or artificially-graded mixture of natural or crushed gravel or crushed stone. Crushed slag is unacceptable. Material shall be coarse aggregate obtained from sources listed on the most recent edition of SCDOT Qualified Products List 2.
   2. Crushed Recycled Concrete Subbase Material:
      a. CONTRACTOR may use crushed recycled concrete material as subbase material.
      b. Recycled concrete material shall be crushed and screened and shall comply with subbase gradation requirements of this Section. Before using in the Work, remove existing reinforcing steel from recycled concrete material.
      c. Crushed recycled concrete material shall not contain chloride ions or aggregates susceptible to alkali-silica reaction.
      d. The pH of recycled concrete material shall not exceed 11.

D. Drainage Fill:

1. Material shall be washed, uniformly-graded mixture of crushed stone, or crushed or uncrushed gravel, with 100 percent passing 1.5-inch sieve and not more than five percent passing a No. 4 sieve.

E. Pipe Bedding Material:
   1. Aggregate material shall be angular, clean washed, crushed stone and gravel, free of: debris, waste, frozen materials, organic material and other deleterious matter. Material shall be Size No. 67 (or, No. 57, for sewer lines) in accordance with ASTM D448 and South Carolina Department of Transportation Standard Specifications.

F. Stone Stabilization Material:
   1. Stone stabilization material shall be angular, clean washed No. 67 stone in accordance with ASTM D448.

2.2 SOURCE QUALITY CONTROL

A. Perform quality assurance testing, and submit results to ENGINEER, in accordance with the 'Quality Assurance" Article in Part 1 of this Section.

PART 3 EXECUTION

3.1 INSPECTION

A. Provide ENGINEER with sufficient notice and with means to examine areas and conditions under which excavating, filling, and grading will be performed. ENGINEER will advise CONTRACTOR in writing when ENGINEER is aware of conditions that may be detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

3.2 TEST PITS

A. General:
   1. In advance of the construction, excavate, make observations and measurements, and fill test pits to determine conditions or location of the existing Underground Facilities and structures. Perform all work required in connection with excavating, stockpiling, maintaining, sheeting, shoring, filling, and replacing pavement for test pits. CONTRACTOR shall be responsible for the definite location of each existing Underground Facility involved within the area of excavation for the Work. Exercise care during such location work to avoid damaging and disrupting the affected Underground Facility or structure. CONTRACTOR shall be responsible for repairing, at his expense, damage to Underground Facility or structure caused during the Work.

3.3 PREPARATION

A. Do not burn clearing debris at the Site unless approved by OWNER and authorities having jurisdiction. If burning is permitted, comply with requirements of authorities having jurisdiction and Laws and Regulations. If burning is permitted at the Site, also comply with OWNER's requirements.

B. Use of Explosives:
   1. Do not bring explosives to the Site or use explosives without written consent of OWNER and authorities having jurisdiction. Obtaining such written consent will not relieve CONTRACTOR of responsibility for injury or damage caused by CONTRACTOR's blasting operations. Submit to ENGINEER copies of written consent and permits for blasting. When permitted, blasting shall comply with Section 31 23 16.26, Rock Removal. CONTRACTOR is solely responsible for handling, storing, and using explosive materials when use of explosives is permitted.

C. Dust Control:
   1. Control objectionable dust caused by CONTRACTOR's operation of vehicles and equipment, clearing, and other actions. To minimize airborne dust, apply water or use other methods subject to ENGINEER's acceptance and approval of authorities having jurisdiction.

D. Maintenance and Protection of Traffic:
   1. Maintain traffic in accordance with the most recent edition of the Watch Area Traffic Control Handbook.

3.4 DEWATERING

A. Dewatering – General:
   1. Provide and maintain adequate drainage and dewatering equipment to remove and dispose of all surface water and ground water entering excavations, or other parts of the Work and work areas. Keep each excavation dry during excavation, subgrade preparation, and continually thereafter until the structure to be built therein is acceptable to ENGINEER and backfilling operations are completed and acceptable to ENGINEER.
   2. Keep all working areas at the Site free of surface water at all times. Provide temporary drainage ditches and temporary dikes, and provide required temporary pumping and other work necessary for diverting or removing rainfall and all other accumulations of surface water from excavations and fill areas. Perform diversion and removal of surface water in manner that prevents accumulation of water behind permanent or temporary structures and at any other locations in the construction area where such accumulations may be detrimental.
   3. Water used for working or processing, resulting from dewatering operations, or containing oils or sediments that will reduce the quality of the surface water or groundwater downstream of the point of discharge, shall not be directly discharged. Divert such waters through temporary settling basin or filter before discharging to surface water, groundwater, or drainage routes.
   4. CONTRACTOR shall be responsible for condition of piping, conduits, and channels used for drainage and such piping, conduits, and channels shall be clean and free of sediment.
   5. Remove water from excavations as fast as water collects.

B. Temporary Dewatering System:
   1. CONTRACTOR shall design, provide, and operate dewatering system to include sufficient trenches, sumps, pumps, hose, piping, well points, deep wells, and similar facilities, necessary to depress and maintain groundwater level 1'-0" below the base of each excavation during all stages of construction operations.

2. Design and operate dewatering system to avoid settlement and damage to existing structures and Underground Facilities.
3. Groundwater table shall be lowered in advance of excavation for a sufficient period of time to allow dewatering of fine grain soils.
4. Maintain groundwater level at excavations two feet below lowest subgrade excavation until the structure has sufficient strength and weight to withstand horizontal and vertical soil and water pressures from natural groundwater.
5. Operate dewatering system continuously, 24 hours per day, seven days per week. Provide standby pumping facilities and personnel to maintain the continued effectiveness of the system. Do not discontinue dewatering operations without first obtaining ENGINEER's acceptance for such discontinuation.
6. If, in ENGINEER's opinion, the water levels are not being lowered or maintained as required, provide additional or alternate temporary dewatering devices as necessary, at no additional cost to OWNER.
7. Locate elements of temporary dewatering system to allow continuous dewatering operation without interfering with the Work to the extent practicable.
8. Where portions of dewatering system are located in the area of permanent construction, submit to and obtain ENGINEER's acceptance of details of proposed methods of constructing the Work at such location. Control of ground water shall continue until the permanent construction provides sufficient dead load to withstand hydrostatic uplift of the normal groundwater, until concrete has attained sufficient strength to withstand earth and hydrostatic loads, and until waterproofing Work is completed.
9. Perform pumping of water from excavations in a manner that prevents carrying away of unsolidified concrete materials, and that avoids damaging the subgrade.
10. Before discontinuing dewatering operations or permanently allowing rise of groundwater level, prepare computations to demonstrate that structures affected by the water level rise are protected by fill or other means to sustain uplift. Use a safety factor of 1.25 when preparing such calculations.

C. Disposal of Water Removed by Dewatering System:
1. CONTRACTOR's dewatering system shall discharge to a suitable location acceptable to OWNER, in accordance with Laws and Regulations.
2. Convey water from excavations in closed conduits. Do not use trench excavations as temporary drainage ditches.
3. Dispose of water removed from excavations in a manner that does not endanger health and safety, property, the Work, and other portions of the Project.
4. Dispose of water in manner that causes no inconvenience to OWNER, others involved in the Project, and adjacent and downstream properties.

3.5 EXCAVATION

A. Perform all excavation required to complete the Work as shown, specified, and required. Excavations shall include removing and handling of earth, sand, clay, gravel, hardpan, soft, weathered or decomposed rock, pavements, rubbish, and other materials within the excavation limits. Where the excavation includes rock that requires drilling, blasting, or specialized equipment for removal, remove rock in accordance with Section 31 23 16.26, Rock Removal.

B. Excavation Protection:

1. Provide excavation protection system(s) in accordance with Laws and Regulations to prevent injury to persons and property, including Underground Facilities.
2. Excavation Less Than Five Feet Deep: Excavations in stable rock or in soil conditions where there is no potential for a cave-in may be made with vertical sides. Under all other conditions, excavations shall be sloped and benched, shielded, or shored and braced.
3. Excavations Greater Than Five Feet Deep: Excavations in stable rock may be made with vertical sides. Under all other conditions, excavations shall be sloped and benched, shielded, or shored and braced.
4. Provide and maintain excavation protection system(s) in accordance with submittals accepted by ENGINEER and required under Paragraph 1.5 of this Section.

C. Maintain excavations in dry condition in accordance with “Dewatering” Article in Part 3 of this Section.

D. Elevation of bottom of footings shown is approximate. ENGINEER may direct such minor changes in dimensions and elevations as may be required to secure a satisfactory footing.

E. When excavations are made below required grades without written order of ENGINEER, fill such excavations with compacted select fill material, as directed by ENGINEER, at CONTRACTOR’s expense.

F. Extend excavations sufficiently on each side of structures, footings, and similar construction to allow setting of forms, installation of shoring and bracing, and the safe sloping of banks, as necessary.

G. Subgrades – General:
1. Subgrades shall be firm, dense, and thoroughly compacted and consolidated; shall be free from mud, muck, and other soft or unsuitable materials; and shall remain firm and intact under all construction operations. Subgrades that are otherwise solid but become soft or mucky on top due to construction operations shall be reinforced with course aggregate material obtained from sources listed on the most recent edition of SCDOT Qualified Products List 2. Finished elevation of stabilized subgrades shall not be above subgrade elevations shown.
2. If, in ENGINEER’s opinion, subgrade becomes softened or mucky because of construction delays, failure to dewater properly, or other cause within CONTRACTOR’s control, subgrade shall be excavated to firm material, trimmed, and backfilled with select fill material at CONTRACTOR’s expense.

H. Proofrolling Subgrades:
1. Prior to placing fill or constructing pavements or slabs, proofroll the subgrade surface with sufficient proofrolling apparatus. Before starting proofrolling, submit to and obtain acceptance from ENGINEER of proofrolling apparatus and procedure to be used.
2. Proofrolling operations shall be made in the presence of ENGINEER. Notify ENGINEER at least 24 hours in advance of start of proofrolling operations.
3. Subgrades displaying pronounced elasticity or deformation, deflection, cracking, or rutting shall be stabilized as directed by ENGINEER. Unsuitable materials shall be undercut to the depth directed by ENGINEER and replaced with select fill material. Other suitable stabilization methods may be directed by ENGINEER.

I. Pipe Trench Preparation:
   1. Not more than 100 feet of trench may be opened in advance of installing pipe in trench unless prior approval is given by the ENGINEER.
   2. Trench width shall be minimized to greatest extent practical, and shall comply with the following:
      a. Trench width shall be sufficient to provide space for installing, jointing and inspecting piping. Refer to Drawings for trench requirements.
      b. Waterlines:
         1) Maximum allowable trench width at the top of pipe shall be equal to the pipe barrel OD plus sixteen inches, unless otherwise shown or indicated.
         2) Prior approval of County Inspector is required to deviate from this; if no prior approval is received, bedding shall be installed per ENGINEER's direction and at Contractor's expense.
      c. Sewer lines: Maximum allowable trench width at the top of pipe shall be:
         1) For 8"-15" pipe, the maximum trench width at the top of pipe shall be nominal pipe size plus 30 inches.
         2) For 18"-30" pipe, the maximum trench width at the top of pipe shall be nominal pipe size plus 36 inches.
         3) For 36" and larger pipe, the maximum trench width at the top of pipe shall be nominal pipe size plus 42 inches.
         4) Prior approval of ENGINEER is required to deviate from maximum allowable widths. Such deviation requiring an increase in bedding and/or change in pipe class will be installed at Contractor's expense.
      d. Trench width shall be sufficient for shoring and bracing, or shielding and dewatering.
      e. Do not use excavating equipment that requires the trench to be excavated to excessive width.
   3. Depth of trench shall be as shown or indicated. If required and approved by ENGINEER in writing, depths may be revised.
   4. Where ENGINEER considers existing material beneath bedding material unsuitable, remove and replace such unsuitable material with select fill material.

J. Excavated Materials to be Used as Fill:
   1. Stockpile excavated materials that are acceptable for use as fill.
   2. As excavation proceeds, keep stockpiles of excavated materials suitable for use as fill separate from unsuitable materials and waste materials.
   3. Place, grade, and shape stockpiles for proper drainage.
   4. Locate and retain soil materials away from edge of excavations.
   5. Dispose of excess soil material and waste materials as specified in this Section.
   6. Stockpiled excavated soils for use as select fill or general fill shall be tested and classified by laboratory as on-Site select fill or on-Site general fill. Perform required quality assurance testing for material verification on stockpiled materials as soon as possible to demonstrate compliance of excavated materials with the Contract Documents.

3.6 UNAUTHORIZED EXCAVATION

A. All excavations outside lines and grades shown or indicated and that are not approved by ENGINEER, together with removing and disposing of the associated material, shall be at

CONTRACTOR's expense. Fill unauthorized excavations with properly-compacted select fill material at CONTRACTOR’s expense.

3.7 EROSION AND SEDIMENT CONTROLS

A. Provide temporary erosion and sediment controls in accordance with York County Engineering Standards 16-series Standard Details and related Standard Details and erosion control requirements. When applicable, also comply with requirements of the erosion and sediment control plan approved by authorities having jurisdiction.

3.8 SHEETING, SHORING, AND BRACING

A. General:
   1. Design and provide sheeting, shoring, bracing, cofferdams, and similar excavation supports as shown, specified, and required for the Work.
   2. Clearances and types of temporary sheeting, shoring, bracing, and similar excavation supports, insofar as they may affect the finished character of the Work and the design of sheeting to be left in place, will be subject to the ENGINEER’s approval; but CONTRACTOR is responsible for adequacy of all sheeting, shoring, bracing, cofferdams, and similar excavation supports.
   3. Materials:
      a. Previously-used materials shall be in good condition, and shall not be damaged or excessively pitted. All steel or wood sheeting designated to remain in place shall be new. New or used sheeting may be used for temporary sheeting, shoring, and bracing.
      b. All steel work for sheeting, shoring, bracing, cofferdams and other excavation supports, shall be in accordance with ANSI/AISC 360, except that field welding will be allowed.
      c. Provide permanent steel sheet piling or pressure-creosoted timber sheet piling where subsequent removal of sheet piling might allow lateral movement of soil under adjacent structures
   4. As excavation progresses, carry down shoring, bracing, cofferdams, and similar excavation supports to required elevation at bottom of excavation.
   5. Comply with Laws and Regulations regarding sheeting, shoring, bracing, cofferdams, and similar excavation supports.
   6. Maintain sheeting, shoring, bracing, bracing, and other excavation supports in excavations regardless of time period excavations will be open.
   7. Unless otherwise shown, specified, or directed, remove materials used for temporary construction when the Work is completed. Perform such removal in manner not injurious to the structures and Underground Facility, their appearance, and adjacent construction.

B. Sheeting Left in Place:
   1. Materials: Steel sheeting shown or indicated to be left in place shall consist of rolled sections of continuous interlocking type. Steel sheeting material designated to be left in place shall be new. Type and design of the sheeting and bracing shall comply with the above requirements for steel work for all sheeting and bracing.
   2. Installation:
      a. Steel sheeting to be left in place shall be driven straight to lines and grades as shown, indicated, or directed. Piles shall penetrate into firm materials with secure

interlocking throughout pile's entire length. Damaged piling having faulty alignment shall be pulled and replaced by new piling.

b. Type of guide structure used and method of driving steel sheeting to be left in place shall be determined by CONTRACTOR's professional engineer. Jetting is not allowed.

3. Cut off at elevations shown, indicated, or directed by ENGINEER sheeting left in place and remove cut off pilings from the Site.
4. Clean wales, braces, and all other items to be embedded in the permanent structure, and ensure that concrete surrounding the embedded element is sound and free of air pockets and harmful inclusions. Provisions shall include the cutting of holes in the webs and flanges of wale and bracing members, and welding of steel diaphragm waterstops perpendicular to the centerline of brace ends that are to be embedded.
5. Subsequent to removing the inside face forms, and when removal of bracing is allowed, cut back steel at least two inches inside the wall face and patch opening with concrete repair mortar in accordance with Section 03 00 05, Concrete. Concrete shall be thoroughly worked beneath wales and braces, around stiffeners, and at other place where voids may be formed.
6. Portions of sheeting or soldier piles and breast boards that are in contact with structure foundation concrete shall be left in place, together with wales and bracing members that are cast into foundation or superstructure concrete.

C. Removal of Sheeting and Bracing:
1. Remove sheeting and bracing from excavations, unless otherwise directed by ENGINEER in writing. Perform removal to avoid damaging the Work and adjacent construction. Removal shall be equal on both sides of excavation to ensure no unequal loads on structures and Underground Facilities.
2. Defer removal of sheeting and bracing, where removal may cause soil to come into contact with concrete, until the following conditions are satisfied:
   a. Concrete has cured for not less than seven days.
   b. Wall and floor framing, up to and including grade level floors, is in place.

3.9 TRENCH SHIELDS

A. Excavation of earth material below bottom of trench shield shall not exceed the limits established in Laws and Regulations.

B. When using a shield for installing piping:
1. Portions of trench shield extending below the mid-diameter of an installed, rigid pipe, such as prestressed concrete pipe and other types of rigid pipe, shall be raised above the pipe's mid-diameter elevation prior to moving the shield along the trench for further construction.
2. Bottom of shield shall not at any time extend below mid-diameter of installed pipe that is flexible or has flexing capability, such as steel, ductile iron, PVC, CPVC, polyethylene, and other pipe that has flexing capability.

C. When using a shield for installing structures, bottom of the shield shall not extend below the top of the bedding for the structures.

D. When removing the shield or moving the shield ahead, exercise extreme care to prevent moving piping, structures, and other Underground Facilities, and prevent disturbance of

bedding material for piping, structures, and other Underground Facilities. When piping, structures, or Underground Facilities are disturbed, remove and reinstall the disturbed items in accordance with the Contract Documents.

3.10 FILL AND COMPACTION – GENERAL PROVISIONS

A. Provide and compact all fill required for the finished grades as shown and as specified in this Section.

B. Place fill in excavations as promptly as progress of the Work allows, but not until completing the following:
   1. ENGINEER's authorization after observation of construction below finish grade, including dampproofing, waterproofing, perimeter insulation, and similar Work.
   2. Inspection, testing, approval, and recording of locations of Underground Facilities.
   3. Removal of concrete formwork.
   4. Removal of shoring and bracing, and filling of voids with satisfactory materials.
   5. Removal of trash and debris.
   6. Permanent or temporary horizontal bracing is in place on horizontally-supported walls.
   7. Field testing of tanks, Underground Facilities including piping and conduits, and water-retaining structures.

C. Fill that includes organic materials or other unacceptable material shall be removed and replaced with approved fill material in accordance with the Contract Documents.

D. Placement – General:
   1. Place fill to the grades shown or indicated. Bring up evenly on all sides fill around structures and Underground Facilities.
   2. Fill areas shall be undercut and proof-rolled as directed by ENGINEER.
   3. Place fill materials at moisture content and density as specified in Table 31 23 05-A of this Section and this Article's requirements on compaction density. Furnish and use equipment capable of adding measured amounts of water to the fill materials to bring fill materials to a condition within required moisture content range. Furnish and use equipment capable of discing, aerating, and mixing the fill materials to ensure reasonable uniformity of moisture content throughout the fill materials, and to reduce moisture content of borrow materials by air drying, when necessary. When subgrade or lift of fill materials requires moisture-conditioning before compaction, fill material shall be sufficiently mixed or worked on the subgrade to ensure uniform moisture content throughout the lift of material to be compacted. Materials at moisture content in excess of specified limit shall be dried by aeration or stockpiled for drying.
   4. Perform compaction with equipment suitable for the type of fill material placed. Select and use equipment capable of providing the minimum density required in the Contract Documents. Use light compaction equipment, with equipment gross weight not exceeding 7,000 pounds within horizontal distance of ten feet from the wall of completed, below-grade structures. Furnish and use equipment capable of compacting in restricted areas next to structures and around piping and Underground Facilities. Effectiveness of the equipment selected by CONTRACTOR shall be tested at start of compacted fill Work by constructing a small section of fill within the area where fill will be placed. If tests on the test section of fill indicate that required compaction is not obtained, do one or more of the following: increase the amount of coverages, decrease the lift thicknesses, or use different compactor equipment.

5. Place fill materials in horizontal, loose lifts, not exceeding specified uncompacted thickness. Place fill in a manner ensuring uniform lift thickness after placing. Mechanically compact each lift, by not less than two complete coverages of the compactor. One coverage is defined as the conditions reached when all portions of the fill lift have been subjected to the direct contact of compactor's compacting surface. Compaction of fill materials by inundation with water is unacceptable.
6. Do not place fill materials when standing water is present on surface of the area where fill will be placed. Do not compact fill when standing water is present on the fill to be compacted. Do not place or compact fill in a frozen condition or on top of frozen material. Fill containing organic materials or other unacceptable material previously described shall be removed and replaced prior to compaction.
7. If required densities are not obtained because of improper control of placement or compaction procedures, or because of inadequate or improperly-functioning compaction equipment, CONTRACTOR shall perform all work required to provide the required densities. Such work shall include, at no additional cost to OWNER, complete removal of unacceptable fill areas and replacement and re-compaction until acceptable fill is provided.
8. Repair, at CONTRACTOR's expense, observed or measured settlement. Make repairs and replacements as required within 30 days after being so advised by ENGINEER.

E. Fill Against Concrete:
1. Placing fill against concrete below finished grade is not allowed until the concrete has attained its specified strength, as determined by duration of concrete curing and testing of field-cured concrete cylinders. Requirements for strength and curing time are in Section 03 00 05, Concrete.
2. Elevation of fill placed against concrete walls shall not differ by more than two feet on each side of walls, unless walls are adequately braced or all floor framing is in place up to and including grade level slabs.
3. Backfill structural foundation units as soon as practicable, in accordance with this Section, after concrete has gained sufficient strength to avoid damage, to avoid ponding of surface water and accumulation of debris.
4. Where fill is placed against waterproofed surface, exercise care that waterproofing material is not damaged.

F. Fill in Electrical Ductbank Trenches:
1. Provide general fill for full depth of electrical ductbank trench, below and above electrical ductbank. Where one ductbank passes beneath another pipe or ductbank, provide select fill to the elevation of the bottom of upper ductbank or pipe, as applicable.
2. Placing and compacting fill in electrical ductbank trenches shall comply with requirements of Paragraph "G. Fill in Pipe Trenches", of this Article.

G. Fill in Pipe Trenches:
1. Place pipe bedding material in pipe trenches in horizontal layers, and thoroughly compact each layer before the next layer is placed.
2. Piping Installed in Fills Above Pre-construction Grade:
   a. Prior to installing piping, place the fill in accordance with the Contract Documents until the fill reaches a minimum elevation two feet higher than the top of piping to be installed. Excavate the trench; install the piping and backfill. Subsequently provide the remainder of the fill required for the Work.

3. Piping trenches may be backfilled prior to testing of piping, unless nature of the test requires observation of pipe during testing. Do not construct building or structure over piping until piping has been successfully tested and passed.
4. Pipe Bedding: Pipe bedding material shall be as indicated on the Drawings or as directed by the ENGINEER and in accordance with York County Standard Drawing Detail No. 15.02.
    a. Place loose backfill by hand around the pipe and completely under the pipe haunches in uniform layers not to exceed 6 inches in depth.
    b. Place each layer and then carefully and uniformly tamp with mechanical tamp, so that the pipe is not damaged nor the alignment disturbed.
    c. Depending upon soil and ground water conditions, greater depths (undercut) may be required to create a stable condition.
    d. When the bottom of the trench is not sufficiently stable to prevent vertical or lateral displacement of the pipe after installation, stone stabilization shall be installed to develop a nonyielding foundation for the bedding and pipe. When such conditions are encountered, the trench shall be excavated to a depth determined by the ENGINEER, and #67 crushed stone shall be placed
5. Placing and Compacting Pipe Trench Fill: Unless otherwise shown, placement and compaction of pipe trench fill materials shall comply with the following:
    a. Pipe bedding material shall be spread and the surface graded to provide a uniform and continuous support beneath piping at all points between bell holes or pipe joints. Slight disturbance of installed pipe bedding material surface during withdrawal of pipe slings or other lifting tackle is acceptable.
    b. After each pipe's bedding material has been graded, and the piping has been aligned, joined in accordance with the Contract Documents, and placed in final position on bedding material, provide and compact sufficient pipe trench fill material under and around each side of the pipe and back of the bell or end thereof to hold piping in proper position and maintain alignment during subsequent pipe jointing and embedment operations. Deposit and compact pipe trench fill material uniformly and simultaneously on each side of piping to prevent lateral displacement of piping. Place and compact pipe trench fill material to an elevation 12 inches above top of pipe, unless otherwise shown or specified.
    c. Each layer of pipe trench fill material shall be compacted by at least two complete coverages of all portions of surface of each lift using appropriate compaction equipment.
    d. Method of compaction and compaction equipment used shall be appropriate for material to be compacted and shall not transmit damaging shocks to the piping.

H. Temporary Pavement:
1. Place 1-1.5 inches of temporary asphalt concrete pavement immediately after filling excavations in paved roadways and other paved areas that will remain for permanent use.
2. Maintain surface of paved area over the fill in good and safe condition during progress of the Work, and promptly fill depressions over and adjacent to the fill area caused by settlement of fill.
3. Permanent replacement pavement shall be equal to that of the existing roadways, unless otherwise shown or specified.

I. Subbase Placement:
1. Provide subbase material where shown to the limits shown or indicated.

2. Place subbase material in compacted lifts not exceeding depth of six inches each.

J. Drainage Fill Placement:
   1. Provide drainage fill material where shown to the limits shown or indicated.
   2. Place drainage fill material in compacted layers of uniform thickness not exceeding depth of six inches each. Compact lifts of drainage fill using suitable compaction equipment.

K. Compaction Density Requirements:
   1. Compaction required for all types of fills shall be in accordance with Table 31 23 05-A of this Section. Moisten material or aerate the material as necessary to provide the moisture content that will facilitate obtaining the required compaction.

TABLE 31 23 05-A
REQUIRED MINIMUM DENSITY

Material	Percent Compaction (ASTM D698)	Uncompacted Lift (inches)
General Fill		
More than five feet below final grade	100	8
Less than five feet below final grade	95	8
Select Fill		
Below concrete slabs or mats	100	8
Below pavement and sidewalks	100	12
Behind concrete walls	95	8
Subbase Material		
Below pavement and sidewalks	100	12
All other locations	100	8
Pipe Bedding Material		
Below structures or pavement	100	8
All other locations	95	6
Drainage Fill	N/A	6

   2. Fill shall be wetted and thoroughly mixed to achieve optimum moisture content plus-or-minus three percent, with the following exceptions:
      a. On-site clayey soils: Optimum to plus three percent.
   3. Replace natural, undisturbed soils or compacted soil subsequently disturbed or removed by construction operations with materials compacted as indicated in Table 31 23 05-A of this Section.
   4. Field quality control testing for density; to verify that specified density was obtained, will be performed during each day of compaction Work. Responsibility for field quality control testing is specified in the “Field Quality Control” Article in Part 3 of this Section.
   5. When field quality control testing indicates unsatisfactory compaction, provide additional compaction necessary to obtain the specified compaction. Perform additional compaction Work at no additional cost to OWNER until specified compaction is obtained. Such work includes complete removal of unacceptable (as determined by

ENGINEER) fill areas and replacement and re-compaction until acceptable fill is provided in accordance with the Contract Documents.

L. Replacement of Unacceptable Excavated Materials: In cases where over-excavation to replace unacceptable soil materials is required, backfill the excavation to required subgrade with select fill material and thoroughly compact in accordance with Table 31 23 05-A and the associated “Compaction Density Requirements” in this Article. Slope the sides of excavation in accordance with the maximum inclinations specified for each structure location.

3.11 GRADING

A. General:
   1. Uniformly grade areas within limits of grading under this Section, including adjacent transition areas.
   2. Smooth subgrade surfaces within specified tolerances, compact with uniform levels or slopes between points where elevations are shown, or between such points and existing grades.

B. Grading Outside Building Lines: Grade areas adjacent to building lines to drain away from structures and to prevent ponding. Finish surfaces free of irregular surface changes, and shall comply with the following:
   1. Grassed Areas or Areas Covered with Gravel, Stone, Wood Chips, or Other Special Cover: Finish areas to receive topsoil or special cover to within not more than one inch above or below the required subgrade elevations.
   2. Sidewalks: Shape surface of areas under sidewalks to line, grade, and cross section, with finish surface not more than one inch above or below the required subgrade elevation.
   3. Pavements: Shape surface of areas under pavement to line, grade, and cross section, with finish surface not more than 1/2-inch above or below the required subgrade elevation.

C. Grading Surface of Fill Under Concrete Slabs: Grade smooth and even, free of voids, compacted as specified, and to required elevation. Provide final grades within a tolerance of 1/2-inch when tested with a ten-foot straight edge.

D. Compaction:
   1. After grading, compact subgrade surfaces to the depth and percentage of maximum density for each area classification.

3.12 PAVEMENT SUBBASE COURSE

A. Comply with York County Ordinance 154.110.

B. General:
   1. Place subbase material, in layers of specified thickness, over ground surface to support pavement base course.
   2. After completing filling and grading, shape and compact pavement subgrade to an even, firm foundation in accordance with this Section. Remove unsuitable subgrade

materials, including soft materials, boulders, vegetation, and loose stones, and replace with compacted fill material as directed by ENGINEER.

C. Grade Control:
   1. During construction, maintain lines and grades including crown and cross-slope of subbase course.

D. Placing of Pavement Subbase Course:
   1. Place subbase course material on prepared subgrade in layers of uniform thickness, in accordance with indicated cross-section and thickness. Maintain optimum moisture content for compacting subbase material during placing operations.
   2. Compaction and Grade Control: Comply with compaction requirements for excavation and fill in this Section, and the following requirements:
      a. Compaction with roller shall begin at the sides of the area to be paved and continue toward the center. Continue compaction until there is no movement of the course ahead of the roller.
      b. After compaction of top lift of pavement subbase, provide and uniformly spread pipe bedding material and screenings compacted, on the surface, and sweep using gang-dragged broom, followed by compaction.
      c. After rolling, check for grade with a line not less than 40 feet in length; depression over 1/2-inch deep shall be filled to satisfaction of ENGINEER.
   3. After completing compaction, other than that necessary for bringing material for the next course, do not haul or drive over the compacted subbase.
   4. Do not install pavement subbase in excess of 500 feet in length without compacting to prevent softening of the subgrade.
   5. If subgrade material becomes churned up into or mixed with the subbase material, remove the mixed material and replace with clean, compacted subbase material.

E. Shoulders:
   1. Place shoulders along edges of subbase course to prevent lateral movement. Construct shoulders of acceptable soil materials placed in such quantity to compact to thickness of each lift of subbase material.
   2. Compact and roll not less than 12-inch width of shoulder simultaneously with compacting and rolling of each lift of subbase material.

3.13 DISPOSAL OF EXCAVATED MATERIALS

A. General:
   1. CONTRACTOR shall haul away material removed from excavations that does not comply with requirements for fill, or is in excess of the quantity required for fill.
   2. Disposal of materials shall be in compliance with Laws and Regulations, at no additional cost to OWNER.

3.14 TEMPORARY BARRIERS

A. Provide temporary barrier surrounding excavations and excavation work areas to provide temporary protection to persons and property. Barrier shall have openings only at vehicular, equipment, and worker access points.

B. Minimum Material Requirements for Temporary Barriers:

1. Temporary barrier shall not be less snow fence-type fencing, four feet high.
2. Fence shall be constructed of vertical hardwood slats measuring not less than 1.5 inches by 1/4-inch interwoven with strands of horizontal wire, or shall be of equivalent plastic construction.
3. Posts:
    a. Posts shall be steel, either “U”-, “Y”-, “T”-shaped, or channel section.
    b. Posts shall have a nominal weight of not less than 1/3-pound per linear foot, exclusive of the anchor.
    c. Posts shall have tapered anchors weighing not less than 0.67 pounds, each firmly attached by means of welding, riveting or clamping.
    d. Posts shall have corrugations, knobs, notches, or studs placed and constructed to engage a substantial number of fence line wire in the proper position.
    e. Provide each post with sufficient quantity of galvanized wire fasteners or clamps, of not less than 0.120-inch diameter, for attaching fence wire to post.

3.15 FIELD QUALITY CONTROL

A. Site Tests: OWNER will employ a testing laboratory to perform field quality control testing. Specific Quality Assurance Testing requirements and procedures shall be established on a Project-by-Project basis.
    1. Responsibilities and Duties of CONTRACTOR:
        a. Use of testing laboratory shall in no way relieve CONTRACTOR of the responsibility to provide materials and Work in full compliance with the Contract Documents.
        b. To facilitate testing laboratory, CONTRACTOR shall advise OWNER at least two days in advance of filling operations to allow for completion of field quality control testing and for assignment of personnel.
        c. It shall be CONTRACTOR’s responsibility to accomplish the specified compaction for fill and other earthwork. CONTRACTOR shall control construction operations by confirmation tests to verify and confirm that CONTRACTOR has complied, and is complying at all times, with the Contract Documents relative to compaction, control.

END OF SECTION

SECTION 31 23 16.26

ROCK REMOVAL

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to perform rock removal required for the Work, including disposing of excavated rock material.
   2. Obtain permits required by authorities having jurisdiction for rock removal Work, including transporting, storing, and using blasting materials.
   3. Perform rock removal Work in compliance with Laws and Regulations applicable permits, and requirements of authorities having jurisdiction.

B. Coordination:
   1. Review procedures under this and other Sections and coordinate the Work that must be performed with or before rock removal.

C. Related Sections:
   1. Section 31 23 05, Excavation and Fill.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. United States Bureau of Mines (USBM), Report of Investigations (RI) 8507.

1.3 TERMINOLOGY

A. The following words or terms are not defined but, when used in this Section, have the following meaning:
   1. “Rock removal” is removal of igneous, metamorphic, or sedimentary rock or stone; boulders over two cubic yards in volume in open areas and boulders over one cubic yard in volume in trenches; and mass concrete; that cannot be removed using rippers or other mechanical methods and therefore requires drilling and blasting or use of large excavator-mounted pneumatic breakers. The following material will not be measured nor allowed for payment as rock removal:
      a. Soft, weathered or disintegrated rock that can be removed by normal excavating equipment, including bulldozers with rippers and large trackhoes with rock teeth or rock buckets.
      b. Loose or previously blasted rock.
      c. Broken stone in rock fills.
      d. Rock or stone that falls into the excavation from outside limits of excavation shown or indicated in the Contract Documents.
      e. Boulders that can be removed without drilling, blasting, or pneumatic breakers.
      f. Pavements, sidewalks, and gutters of concrete, asphalt, or masonry.
   2. “Trenches” means excavations having vertical sides whose depth exceeds its width, made for Underground Facilities and drainage beds.

1.4 QUALITY ASSURANCE

A. Qualifications:
   1. Professional Engineer:
      a. CONTRACTOR or blasting Subcontractor shall retain a registered professional engineer legally qualified to practice in South Carolina. Professional engineer shall have at least five years experience conducting preblast surveys, structural evaluations, and structural condition assessments.
      b. Responsibilities include:
         1) Preparing or supervising preparation of preblast survey.
         2) Preparing written requests for clarifications or interpretations of the Contract Documents for submittal to ENGINEER by CONTRACTOR.
         3) Signing and sealing preblast survey report.
         4) Performing condition assessments of structures damaged by blasting.

1.5 SUBMITTALS

A. Informational Submittals: Submit the following:
   1. Test and Evaluation Reports:
      a. Rock surface survey information, in accordance with Part 3 of this Section.
      b. Preblast survey report, in accordance with Part 3 of this Section.
      c. Blasting records, when requested by ENGINEER, in accordance with Part 3 of this Section.
      d. Vibration and overpressure monitoring results, in accordance with Part 3 of this Section.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 EXAMINATION

A. Top-of-Rock Survey:
   1. Prior to blasting and rock removal, CONTRACTOR shall survey and measure the elevation of the top of rock to determine the in-place quantity of rock to be excavated.
   2. Uncover rock to be excavated in sections or areas acceptable to ENGINEER for surveying.
   3. Submit to ENGINEER field notes, site plan showing rock elevations measured, cross-sections of rock surface when necessary or required by ENGINEER, and detailed estimation of quantity of rock to be excavated.

3.2 PREBLAST SURVEY

A. General:
   1. Preblast survey shall be performed or supervised by CONTRACTOR's or Subcontractor's professional engineer qualified in accordance with Part 1 of this Section.
   2. Complete preblast survey before starting blasting and rock removal.
   3. Preblast Survey Limits:

a. Preblast survey shall document the preblast condition, defects, and other physical factors that could reasonably be affected by blasting, of all existing residences; commercial, industrial, and institutional buildings; water supply wells; Underground Facilities and above-ground utilities; and other structures within the greater of the following distances from the limits of rock removal Work to be performed by blasting: 500 feet, or limit required in Laws and Regulations.
b. Preblast survey shall include structures such as dams, ponds and reservoirs, cisterns, structures of historical significance, and structures with unusually costly or vulnerable contents.
c. Preblast survey shall document the species and sensitivity of livestock and other animals that could be affected by blasting.

4. If, during the Work, CONTRACTOR is requested by a property owner or tenant to view alleged damage to property, CONTRACTOR shall give written notice to OWNER prior to visiting to the property.

B. Preparation for Preblast Survey:
1. Contact all owners and tenants, or their legal representative, of properties within limits of preblast survey to obtain permission to conduct preblast survey of the associated property. If property owner and tenant (if any) does not grant permission to conduct preblast survey, contact property owner and tenant (if any) a second time by registered mail (return receipt requested). Second request for permission to conduct preblast survey shall include description of preblast survey to be performed and purpose of preblast survey. At least 72 hours prior to starting blasting, provide to authority having jurisdiction, in writing, names and addresses of property owners and tenants (if any) who refuse access for preblast survey.
2. Notify property owners and tenants at least 48 hours prior to conducting preblast survey.
3. Not less than 48 hours before conducting blasting, submit preblast survey report as specified in Paragraph 3.2.D of this Section.

C. Method:
1. Buildings, Structures, Underground Facilities, and Above-ground Utilities:
a. Include in preblast survey detailed examination of interior and exterior of structures, Underground Facilities, and above-ground utilities located within specified limits of preblast survey.
b. Underground Facilities: With owner of Underground Facility, document condition of access points such as chambers, manholes, and vaults. Televise the underground pipes or conduits as noted in the Drawings.
c. Obtain color photographs, video, and prepare sketches and written descriptions to document the condition of areas within specified limits of preblast survey.
d. Document evident structural faults or deficiencies and recent repairs.
2. Wells: Include in preblast an assessment of water supply wells located within specified limits of preblast survey, including:
a. Information on well's date of construction, depth, method of construction, yield, water quality, and other existing available data. Obtain information from owner of well and installer (if known).
b. Perform short-duration pump test on each well utilizing existing pump serving the associated well. Activate pump, measure volume of water and drawdown in the well for period of one-hour or less until approximate steady state conditions are achieved. Use data obtained from these measurements to estimate approximate yield of each well.

c. Upon completion of specified short-duration pump test, obtain groundwater sample from well and submit to water quality laboratory certified by authority having jurisdiction for potable water wells. Cost of laboratory testing shall be paid by CONTRACTOR. Laboratory shall analyze samples for iron, manganese, total dissolved solids, turbidity and total coliform using methods acceptable to authority having jurisdiction for potable water wells.

D. Survey Report:
   1. General:
      a. Prepare written report summarizing results of preblast survey.
      b. Not less than 48 hours before blasting, submit two copies of completed preblast survey report to each authority having jurisdiction for their reference, if required. Submit one copy of preblast survey to OWNER, two copies to ENGINEER, and retain one copy at the Site.
      c. CONTRACTOR's or Subcontractor's professional engineer shall sign and seal final preblast survey report.
   2. Contents: Preblast survey report shall contain the following:
      a. Location and description of each property within or partially within the specified preblast survey limits.
      b. Descriptions of conditions of buildings, structures, Underground Facilities, above-ground utilities, wells, and other elements included in the preblast survey.
      c. Summary of visual observations and inspections.
      d. Color photographs, sketches, and video as appropriate.
      e. All data, results, and yield estimates developed from water supply well assessments.
   3. Photographic Documentation: Provide video to present supplemental information, as required. Include in photographs and video (where appropriate) a scale to indicate dimensions. Label photographs with name of the professional engineer responsible for preblast survey, name of property owner, and sufficient information to determine the location of the image. Include in preblast survey report one print of each photograph and include discs with video and electronic copies of photographs.
   4. CONTRACTOR's or Subcontractor's professional engineer shall report all findings that, in professional engineer's opinion, indicate that building, structure, Underground Facility, above-ground utility, or well will be adversely affected by the rock removal and blasting Work.

3.3 BLASTING AND ROCK REMOVAL

A. Notify the York County Department of Fire Safety – Fire Prevention Section or the York County Fire Administrator and obtain blasting permits prior to commencing any blasting operations.

B. Perform blasting in accordance with Laws and Regulations relative to blasting, storage and use of explosives, and rock removal.

C. Perform rock removal adjacent to Underground Facilities and above-ground utilities and life-safety facilities with utmost care, after properly notifying and coordinating with utility owners, life-safety facility owners, and authorities having jurisdiction.

D. Perform blasting to avoid endangering persons or property, and damaging or weakening adjacent foundations, structures, sheeting, bracing, and other facilities. Cover or otherwise suitably confine blasting.

E. CONTRACTOR shall be fully responsible for injury and damage caused by blasting, and shall repair or replace all injury and damage immediately, as accepted by ENGINEER at no additional cost to OWNER.

F. Limit Criteria for Blasting Vibration, Particle Velocity, and Airblast Overpressure:
   1. Amount of vibration, frequency and overpressure generated by blasting shall not exceed limits in Laws or Regulations, and limits established by authorities having jurisdiction.
   2. Maximum peak particle velocity (PPV) shall not exceed limits indicated in Figure B-1, Appendix B, of the USBM RI 8507.
   3. Peak airblast overpressure measured at location of nearest occupied, above-ground structure (considering wind direction) shall not exceed 0.014 psi.

G. Keep records of all blasts, including: date; location, depth, number, and diameter of drill holes; type and amount of explosive; and other pertinent data. Submit records to ENGINEER when requested.

H. Removal by Methods Other than Blasting:
   1. Where conditions of hazard exist, or clearances with existing facilities, piping, or structures are very small, or where the potential for damage to persons or property is strong, perform rock removal by means other than blasting.
   2. Blasting is not allowed except in areas where so allowed by Fire Department Blasting Permit as issued by the Office of State Fire Marshal.

I. Removal and Disposal of Rock:
   1. Remove blasted or broken rock from excavations with suitable equipment.
   2. Do not use excavated rock as backfill. Dispose of excavated rock off the Site at CONTRACTOR's expense in compliance with Laws and Regulations.

3.4 SITE QUALITY CONTROL

A. Blast Monitoring:
   1. Perform seismic blast monitoring in accordance with Laws and Regulations.`
   2. Monitor blasting to allow evaluation of compliance with the limitations specified in the Contract Documents. At minimum, monitor each blast as follows:
      a. Blast Monitoring Zone: Monitor vibrations at exterior walls of all structures within 500 feet of each blast.
      b. If no structures are located within specified blast monitoring zone, monitor vibrations at three equally spaced radial points located at perimeter of specified blast monitoring zone.
      c. Monitor overpressures for all structures within specified blast monitoring zone.
   3. Submit vibration and overpressure monitoring results to ENGINEER within 24 hours of blasting. CONTRACTOR's monitoring does not relieve CONTRACTOR of responsibility for controlling vibration and overpressure during blasting.

3.5 UNAUTHORIZED ROCK REMOVAL

A. Rock removal outside the limits shown or indicated in the Contract Documents or that is not approved by ENGINEER, including removal, disposal, and backfill, will be at CONTRACTOR's expense.

B. Fill unauthorized excavation below pipe or foundation with compacted select backfill as directed by ENGINEER in writing, at no additional cost to OWNER. Backfill other unauthorized excavation as specified in Section 31 23 05, Excavation and Fill.

END OF SECTION

SECTION 31 37 00

RIPRAP

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals required to furnish and install riprap at locations shown or indicated in the Contract Documents.

B. Coordination:
   1. Review procedures under this and other Sections and coordinate the Work that must be performed with or before riprap.

C. Related Sections:
   1. Section 03 00 05, Concrete.
   2. Section 31 11 00, Clearing and Grubbing.
   3. Section 31 23 05, Excavation and Fill.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASTM C127, Test Method for Density, Relative Density (Specific Gravity), and Absorption of Coarse Aggregate.
   2. NSSGA-293, Aggregate Handbook.
   3. South Carolina Department of Transportation (SCDOT) Qualified Products Listings and Policies for Construction and Maintenance Materials.
   4. South Carolina Department of Transportation Standard Specifications for Highway Construction.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Riprap Supplier:
      a. Supplier of riprap and other materials furnished under this Section shall be certified by the SCDOT for furnishing such materials for SCDOT highways.

B. Regulatory Requirements:
   1. Reference Specifications and Details:
      a. Comply with applicable requirements of SCDOT Standard Specifications for Highway Construction.

1.4 SUBMITTALS

A. Acton Submittals: Submit the following:
   1. Product Data:
      a. Source or quarry name, gradation, and other information required by ENGINEER. Submit for each source of material proposed.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Where material is specified according to reference specification item number, submit copy of Supplier's valid certification from entity issuing the reference specification, and associated certification of material conformance with the reference specifications.

PART 2 PRODUCTS

2.1 MATERIAL

A. Riprap: Material shall comply with Section 804 of SCDOT Standard Specifications for Highway Construction, Class B and shall be obtained from sources listed on the most recent edition of SCDOT Qualified Products List 2.

B. Width and thickness of each stone shall not be less than one-third the length of the stone.

PART 3 EXECUTION

3.1 PREPARATION

A. Clear ground surface of brush, trees, stumps, and other objectionable material, and dress to a smooth surface. Clearing and grubbing, where required, shall comply with Section 33 11 00, Clearing and Grubbing.

B. Remove all soft or spongy material to depth shown or indicated on the Drawings or as directed by ENGINEER, and replace with acceptable material. Excavation, removal of unsuitable material if any, and backfilling shall comply with Section 31 23 05, Excavation and Fill.

3.2 INSTALLATION

A. Riprap Placing:
   1. Minimum total thickness of riprap shall be as specified in Article 2.1 of this Section.
   2. Place riprap stones so that weight of stone is carried by underlying material and not by adjacent stones. Carefully place the stones on geosynthetics, where required, to produce an even distribution of pieces, with minimum of voids and without damaging the geosynthetic. Place the full-course thickness in one operation while preventing segregation and avoiding displacing of underlying material. Do not place stones in layers, by dumping into chutes, or by other methods that cause segregation or damage to geosynthetic, if any. When necessary, rearrange individual stones for uniform distribution.
   3. Riprap may be placed using equipment, and placing shall produce an installation of firm and solid riprap. Level the top surface of riprap to required alignment and slope by hand-placing stones to fill large voids and to make surface even.
   4. On slopes, place the largest stones at the bottom. Riprap shall be properly sized to form compact, solid blanket to protect the slope or channel, as applicable.
   5. Rip-rap shall be installed no steeper than a 2:1 slope except when specifically approved by the Engineer. On such slopes, do not use rounded boulders or cobbles without grouting stones in place.

6. Grouting: Where grouting of riprap is required, comply with the following:
    a. When stones are in place, completely fill spaces between stones with “grout fill” material in accordance with Section 03 00 05, Concrete.
    b. ENGINEER may direct that occasional spaces be left ungrouted for relief of hydrostatic pressure. Chink ungrouted spaces with spalls of suitable size.
    c. Do not grout riprap in freezing weather.
    d. Clean exposed surface of stones to remove accumulation of grout.
    e. Keep grouted riprap moist for seven days after grouting. Suitable grout curing compound may be employed when approved by ENGINEER.
7. When existing riprap is in proximity to riprap provided under this Section, place riprap to conform as closely as practicable in size and character to existing riprap.
8. Unless otherwise indicated, existing riprap removed to facilitate other Work shall be reinstalled or replaced at no additional cost to OWNER.
9. In locations where a creek bank is eroded near a sewer line, before placing riprap, place compacted fill material along the creek bank in order to maintain 3 feet of cover over the sewer line.

END OF SECTION

SECTION 31 62 16.16

STEEL H-SECTION PILES

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish, install, and test steel H-section piles.
   2. Extent of steel H-section piling is shown on the Drawings.
   3. Included are:
      a. Furnishing, driving, cutting off, and all other steel H-section piling Work.
      b. Providing openings in and attachments to steel H-section piling to accommodate the Work under this and other Sections, and providing for steel H-section piling all items required for which provision is not specifically included under other Sections.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before steel H-section piling Work.

C. Related Sections:
   1. Section 31 23 05, Excavation and Fill.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASTM A572/A572M, Specification for High-Strength Low-Alloy Columbium- Vanadium Structural Steel.
   2. ASTM D1143/D1143M, Test Method for Deep Foundations Under Static Axial Compressive Load.
   3. ASTM D3689, Test Methods for Deep Foundations Under Static Axial Tensile Load.
   4. ASTM D3966, Test Methods for Deep Foundations Under Lateral Load.
   5. ASTM D4945, Test Method for High-Strain Dynamic Testing of Piles.
   6. ASTM D7091, Practice for Nondestructive Measurement of Dry Film Thickness of Nonmagnetic Coatings Applied to Ferrous Metals and Nonmagnetic, Nonconductive Coatings Applied to Non-Ferrous Metals.
   7. ASTM E329, Specification for Agencies Engaged in Construction Inspection and/or Testing.
   8. ASTM E376, Practice for Measuring Coating Thickness by Magnetic-Field or Eddy-Current (Electromagnetic) Examination Methods.
   9. AWS D1.1/D1.1M, Structural Welding Code – Steel.
   10. International Building Code.
   11. Ozone Transport Commission (OTC) Architectural and Industrial Maintenance Coatings.
   12. SSPC-PS 11.01, Black (or Dark Red) Coal Tar Epoxy Polyamide Painting System.
   13. SSPC-SP 1, Solvent Cleaning.
   14. SSPC-SP 10/NACE No. 2, Near White Blast Cleaning.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Welders and Welding Processes:
      a. Qualify welding processes and welding operators in accordance with AWS D1.1/D1.1M, Section 5, Qualification.
      b. Each welder employed on or to be employed for the Work shall possess current AWS certification in the welding process with which welder will be working. Certifications shall be current and valid throughout the Work.
   2. Surveyor:
      a. Engage a registered professional land surveyor legally qualified to practice in the same jurisdiction as the Site, and experienced in providing surveying services of the kind indicated.
      b. Responsibilities include but are not necessarily limited to:
         1) Performing or supervising performance of field survey work to check lines and elevations of steel H-section piling, before proceeding with construction of pile caps.
         2) Submit to CONTRACTOR field survey reports.
   3. Professional Engineer:
      a. Retain the services of a registered professional engineer, legally qualified to practice in the same jurisdiction as the Site, to design all required static load-testing apparatus, including loaded members, support frames, loading procedures, and test movement recording devices. Test beams, load platforms, and support structures, as required, shall have sufficient size, strength, and stiffness to prevent excessive deflection and instability up to the maximum anticipated load.
      b. Responsibilities include but are not necessarily limited to:
         1) Reviewing load testing criteria stated in the Contract Documents.
         2) Preparing or supervising preparation of design calculations and related drawings, Shop Drawings, and loading procedures.
         3) Signing and sealing all calculations, design drawings, and Shop Drawings.
         4) Certifying that:
            a) it has performed the design of the loading apparatus in accordance with design criteria stated in the Contract Documents, and
            b) said design complies with Laws and Regulations, and complies with prevailing standards of practice.
   4. Dynamic Pile Testing Consultant:
      a. Retain the services of a dynamic pile testing consultant to provide necessary equipment, and perform dynamic testing and wave equation analysis to determine the ultimate pile capacity of dynamically-tested piles as indicated in the Contract Documents.
      b. Dynamic pile testing consultant shall be a professional engineer legally qualified to practice in same state as the Site and shall have a minimum of five years experience with dynamic pile testing, data interpretation, and wave equation analysis.
      c. Responsibilities include but are not necessarily limited to:
         1) Preparing or supervising preparation of the dynamic pile testing plan.
         2) Preparing or supervising the preparation of test set-ups.
         3) Performing or supervising performance of testing, interpretation, and engineering analysis of test data, and preparing test reports.
         4) Signing and sealing the dynamic pile testing report.
   5. Pile Installer:
      a. Engage an experienced pile installer possessing a minimum of five years experience installing piles similar to those required in this Section, to perform all H-section pile driving indicated in the Contract Documents.

6. Static Load Test Application and Recording of Data:
    a. Maintain presence of experienced employees at all times during steel H-section pile Work to perform the required loading and recording of data during static load testing. Individuals responsible for the Work shall have a minimum of five years of experience in similar projects.

B. Regulatory Requirements:
1. If coatings are required, comply with VOC content limits of OTC Model Rule for Architectural and Industrial Maintenance Coatings:
    a. Industrial Maintenance Coatings: 340 grams per liter.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
1. Shop Drawings: Submit the following in advance of start of pile driving:
    a. Drawings showing location of all piles. Assign an identification number to each pile coinciding with identification number used in driving record of each pile. Shop Drawings shall include anticipated driving sequence for the Work.
    b. Complete data on type of pile proposed, including pile installation procedures.
    c. Submit detailed drawings of pile splices. Clearly indicate welds using standard AWS notations and symbols, and clearly show or indicate size, length, and type of each weld, as applicable.
    d. Submit detail of pile tension connection. Clearly indicate welds using standard AWS notations and symbols, and clearly show or indicate size, length, and type of each weld, as applicable.
2. Product Data:
    a. Copies of manufacturer’s specifications and installation instructions for products listed below.
        1) Welding electrodes and rods.
        2) Protective coating manufacturer’s technical information and test performance data, including paint analysis, VOC and chemical component content in comparison to maximum allowed by the Contract Documents, and application instructions. Submit proof of acceptability of proposed application techniques by paint manufacturer selected.

B. Informational Submittals: Submit the following:
1. Certificates.
    a. Welders’ certifications.
    b. Laboratory test reports and other data as required to demonstrate compliance with these Specifications for the products listed below:
        1) Structural steel of each type, including certified copies of mill reports covering chemical and physical properties.
2. Complete data on hammer and other driving equipment to be utilized, including results of drivability studies.
3. Pile Load Test Plan:
    a. Submit pile load test plan, including complete data on test pile instrumentation, load application, apparatus for recording movement, and protection of testing apparatus, at least 30 days prior to installing the first test pile. ENGINEER's acceptance of pile load test plan shall not relieve CONTRACTOR of responsibility for structural and operational adequacies of the testing system.

1) Dynamic load test requirements included in the pile load test plan shall be prepared by CONTRACTOR's dynamic pile load testing consultant.

b. Calibration curve for jack and gauge to be used for static load testing, to demonstrate compliance with required ASTM standards, certified by testing laboratory.

c. Calibration statements for equipment to be used to obtain dynamic measurements, record, reduce and display data to demonstrate compliance with ASTM D4945, certified by testing laboratory.

4. Field Quality Control Submittals:
   a. Static Load Test Reports: Within two days of completing test, submit test report for each pile test, in accordance with Article 3.6 of this Section.
   b. Dynamic Test Report: Submit dynamic test report, including wave equation analysis, within seven days after completing tests.
   c. Coating Test Reports: Submit test report within two days of completing holiday tests and dry film thickness tests.
5. Driving Records:
   a. Within two days of driving, submit copies of driving record of each pile, including the following information:
      1) Project name, Contract number, report date, date of pile driving.
      2) CONTRACTOR and Subcontractor names.
      3) Pile location and number.
      4) Pile section designation.
      5) Starting and finishing driving times.
      6) Type and size of hammer.
      7) Pile driving cap type.
      8) Ground, tip, and butt elevation. Indicate butt elevation before and after cut-off.
      9) Total pile pay length.
      10) Locations of splices, if any.
      11) Continuous record of number of blows for each foot of penetration and for each inch of penetration in the last foot of penetration.
      12) Data on and description of unusual occurrences, if any, during pile driving.
6. Qualifications Statements.
   a. Land surveyor.
   b. Professional engineer.
   c. Dynamic pile testing consultant.
   d. Pile installer.
   e. Qualifications of each individual employed to perform static load test application and recording of data.

C. Closeout Submittals: Submit the following:
   1. Field survey reports showing exact location of each steel H-section pile as driven, including record drawings and data showing final position of top of each pile. Include location of rejected piles.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery:
   1. Except for piles to be used for testing, materials ordered or delivered to the Site prior to verification of assumed pile length are at CONTRACTOR's risk.
   2. After pile lengths are verified, deliver materials to Site in such quantities and at such times to ensure continuity of pile driving operations in accordance with the Progress Schedule accepted by ENGINEER.

B. Storage: Store piles in orderly groups above ground on blocks to minimize potential for distortion.

C. Handling:
   1. Lift piles using a cradle or multiple point pick-up to ensure that the maximum permissible camber or sweep is not exceeded due to insufficient support. Point pick-up devices shall be of the type that clamps to both pile flanges at each pick-up point.
   2. Holes may be burned in the flanges or webs of piles above the cut off length for lifting piles into the leads.
   3. Do not drag piles across the ground.
   4. Piles with excessive camber or sweep will be rejected.

1.6 SITE CONDITIONS

A. Site Information:
   1. Information on subsurface conditions is available in the reports listed in the Supplementary Conditions.
   2. Additional test borings and other exploratory operations may be made by CONTRACTOR at no additional cost to OWNER, provided such operations are acceptable to ENGINEER.

B. Line and Level:
   1. Using reference points and engineering surveys provided by OWNER, establish and locate all other lines and levels and is responsible for the correct location and deviation of all piles.
   2. Install piles at the proper locations and orientation shown or indicated in the Contract Documents.

PART 2 PRODUCTS

2.1 MATERIALS

A. H-Section Piles:
   1. Provide structural H-section shapes, complying with ASTM A572/A572M, Grade 50, of the sizes shown or indicated on the Drawings.

2.2 PROTECTIVE COATINGS

A. Coating Material:
   1. Surface Preparation: Refer to Paragraph 3.2.A of this Section.
   2. Shop Applied Coating and Field Touch-Up Materials:
      a. Coal Tar Epoxy Polyamide:
         1) System: SSPC-PS 11.01.
         2) Material: SSPC Paint 16.
      b. Products and Manufacturers: Provide one of the following:
         1) Hi-Mil Sher-Tar Epoxy B69B40/B60V40, manufactured by Sherwin Williams Company.
         2) Hi-Build Tneme-Tar, Series 46H-413, manufactured by Tnemec Company, Inc.
         3) Or equal.

2.3 PILE TENSION CONNECTIONS

A. Provide steel H-section piling with tension connections to the pile cap as shown on the Drawings.

B. Pile tension connections shall comply with the details on the Drawings.

2.4 DRIVING EQUIPMENT

A. General:
   1. Drive piles with a drop, single- or double-acting steam, air, or diesel hammer. Use a hammer with sufficient energy to drive piling to required tip elevation without damaging the pile. Operate double-acting hammer, if used, at full-rated pressure and speed during final driving of pile. When using single-acting hammer, maintain valve mechanism as recommended by manufacturer so that length of stroke is maintained. Equip diesel hammers, when used, with chambers and gages arranged so that precise energy information can be read and recorded. Hammer shall be in good operating condition at all times during driving.
      a. Size or capacity of hammers shall be as recommended by hammer manufacturer for the total pile mass weight and character of soil formation to be penetrated.
      b. Perform drivability studies that are based on wave equation analysis. Drivability study shall demonstrate hammer can successfully drive the piles to the anticipated pile tip elevations and with sufficient energy to produce design pile capacity without damage to the pile and without excessive blow count.
      c. Provide further wave equation analysis at no cost to OWNER if hammer system is replaced or modified.

B. Driving Caps:
   1. Equip hammer with cushioned or blocked driving cap, conforming to pile shape, with loss of hammer energy kept to a minimum. Keep bearing surfaces of driving cap true and smooth.
      a. Driving cap shall be consistent with the wave equation analysis.

C. Pile Driving Leads:
   1. Use fixed or rigid type pile driving leads that will hold pile firmly in position and in axial alignment with hammer. Free-swinging leads are unacceptable. Extend leads to within two feet of elevation at which pile enters ground.

PART 3 EXECUTION

3.1 INSPECTION

A. Examine areas and conditions under which steel H-section piling will be installed and notify ENGINEER in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

B. Inspect piles for excessive camber and sweep, and for damage before transporting pile materials from storage area to driving location, and inspect immediately prior to placing pile material in the driving leads. Measure camber and curvature in the pile in direction normal to the

pile flanges, with the pile flange laying on the surface; measure the distance between the flange base at mid-length of pile and the flat surface. Measure sweep and curvature in the pile in direction parallel to the pile flanges with the pile flange tips laying on a flat surface; measure the distance between flange tips at mid-length of the pile and the flat surface. Maximum acceptable camber or sweep is two inches over the length of the pile.

3.2 PROTECTIVE COATINGS

A. Provide protective coating for pilings in corrosive soils, pilings exposed above-ground or if otherwise indicated in the Drawings.

B. Cleaning and Preparation of Coated or Painted Surfaces:
   1. Solvent Cleaning:
      Remove visible oil, grease and other contaminants by solvent cleaning in accordance with SSPC-SP 1.
   2. Blast Cleaning:
      a. After solvent cleaning, complete surface preparation by near-white blast cleaning in accordance with SSPC-SP 10/NACE No. 2. Remove residual dust from blasted surface by blowing with dry, oil-free air, vacuuming, or sweeping.
      b. Comply with paint manufacturer's recommendations for type and size of abrasive to provide surface profile that complies with manufacturer's painting system requirements.

C. Mixing:
   1. Mix and prepare paint products in accordance with paint manufacturer's product literature and manufacturer's preparation instructions.

D. Application:
   1. Apply coating to blast-cleaned steel in accordance with paint manufacturer's written instructions.
   2. Coal-tar Epoxy: Apply by spraying one coat to total minimum dry film thickness of 16 mils and maximum dry film thickness of 20 mils.
   3. Provide finish coating that is generally smooth and free of projections that can be removed by abrasion. Remove sharp edges and repair areas in accordance with paint manufacturer's directions.

E. Field Touch-Up:
   1. Touch-up damaged shop-applied paint using materials as specified under Article 2.2 of this Section in accordance with paint manufacturer's instructions.

3.3 PREPARATION FOR PILE INSTALLATION

A. Preparation of Site:
   1. Do not drive piles until earthwork in the area where piles will be installed has been performed as follows:
      a. Excavation, fill, and earthwork shall be in accordance with Section 31 23 05, Excavation and Fill.
      b. Excavation: Stop excavating at elevation six inches to twelve inches above bottom of footing before piles are driven. Final excavation to required elevation of footing bottoms shall be after piles are installed and tested.
      c. Fills: Construct and compact fills to elevation shown.

2. Do not drive pile within 15 feet of concrete or masonry structure that has not attained its full design strength.

B. Pile Length Markings:
   1. Mark length of pile by painting the number of feet from pile tip at five foot intervals and painting a horizontal line, at 12-inch intervals, starting 15 feet below pile cut-off.

C. Welding:
   1. Perform manual arc welding using shielded metal arc method or submerged arc method complying with AWS D1.1/D1.1M.
   2. Use oxygen-gas or oxygen-arc methods for field cutting steel, complying with AWS D1.1/D1.1M.

D. Splices:
   1. In general, use only one splice per length of pile.
      a. Piles that have not reached required tip elevation or refusal blow count when the top has been driven to cutoff elevation shall be spliced as shown and driven to sufficient depth to develop the required tip elevation or refusal blow count.
   2. Clean surfaces to be welded of rust, scale, oil, paint, and foreign material. Use only pile members with identical cross-sections for splicing.
   3. When possible, make splices before starting driving operations. If welded splice is required during driving operation, make splice when top of driven pile portion is at least three feet above ground, to allow inspection of welded connection during welding and during subsequent driving. Length of pile to be spliced shall be secured in proper alignment to avoid eccentricity.
   4. Splices shall be 100 percent butt welded, producing a straight pile alignment through splice and developing full bending strength and axial load strength of pile.
   5. After splices are made, inspected, and acceptable to ENGINEER, touch-up and repair protective coatings on piles using same material used in shop-applied paint or coating systems, in accordance with manufacturer's instructions.

E. Pre-drilling:
   1. Pre-drilled holes for pile installation are allowed only when approved by geotechnical engineer or ENGINEER of record.

F. Jetting:
   1. Jetting and spudding of piles is not allowed.

3.4 DRIVING PILES

A. Protection:
   1. Protect structures, Underground Facilities, and other construction from damage caused by pile driving operations.
   2. When structures are adjacent to pile driving operations, before commencing pile driving, provide surveyed elevation benchmarks on structure at locations directed by ENGINEER. Record and report the elevation of each benchmark after driving each pile and at least twice a day while pile driving is in progress. Should benchmark readings indicate displacement, halt pile driving operations until corrective action is provided acceptable to ENGINEER.

B. General:

1. Provide written notice prior to beginning construction on steel piles to OWNER and ENGINEER. Don't perform any pile driving without Inspector present.
2. Perform pile driving in an orderly sequence, progressing in one direction across each foundation element. Do not install piles in area surrounded by previously driven piles. Drive piles only in ENGINEER's presence.
3. Continuously drive each pile at location indicated, to the required tip elevation and driving resistance established by driving and loading of test piles and load testing analysis.
    a. Piles shall be driven to resistance or pile refusal criteria provided by the geotechnical engineer or as indicated on the Drawings.
4. Carefully maintain center of gravity for each group or cluster of piles to comply with locations shown.
5. Carefully plumb leads and pile before driving. During driving prevent and correct tendency of piles to twist or rotate.
6. When handling and driving long piles, take special precautions to prevent overstress or leading away from true position.

C. Obstructions:
1. Should an obstruction including, but not limited to, boulders, rock, rubble, fill, or existing foundations be encountered that prevents driving of pile to its required tip elevation or final driving resistance, threaten pile damage, or cause pile to drift from required location, cease driving operation and contact ENGINEER immediately. ENGINEER will determine corrective measures, including, but not necessarily limited to, pile relocation and pile cap design modifications required to accommodate the obstruction. Corrective measures due to obstructions, including cost of redesign, will be paid by OWNER via a Change Order or other method in accordance with the Contract Documents.

D. Driving Tolerances:
1. Drive piles within the following maximum tolerances:
    a. Location: Three inches from location indicated for center of gravity of each single pile or pile groups; one inch for piles under walls.
    b. Plumbness: Maintain one inch in ten feet from vertical, or a maximum of four inches, measured when the pile is above ground, in the leads.
    c. Batter Angle: Maximum one inch in ten feet from required angle as shown on the Drawings, measured when pile is above ground and in the leads.

E. Cutting-Off:
1. Cut off tops of driven piles square with pile axis and at elevations indicated, using cutting torch or other acceptable method.
2. Piles driven below required cutoff elevation are not acceptable and shall be replaced at no additional cost to OWNER.
3. Recoat cut off tops of piles that have protective coating. Touch-up and repair protective coatings on piles using same material used in shop-applied coating systems, in accordance with paint manufacturer's instructions.

3.5 REPAIRS AND CORRECTIONS

A. Corrective Action:
1. ENGINEER may survey piles at any time. If heave or other discrepancy is detected, re-drive or replace the pile or piles at no additional cost to OWNER.

2. As soon as possible after completing pile driving, prepare an accurate survey by licensed surveyor. Partial surveys of piles at cutoff elevation can be submitted as driving proceeds to expedite the Work.
3. ENGINEER will check piling and determine acceptability. If unacceptable, ENGINEER will advise CONTRACTOR what additional piles shall be provided or other corrective measures to be taken.
4. ENGINEER will provide redesign, as required, for corrections required for piles driven out of location. Corrective measures, including cost of redesign, shall be paid by CONTRACTOR via Change Order.

B. Damaged or Misdriven Piles:
1. Damaged piles and piles driven outside required driving tolerances, piles that are too short to develop the required final driving resistance or required tip elevation, or that otherwise do not comply with the Contract Documents, are considered defective and are unacceptable.
2. Damaged piles shall include, but not necessarily be limited to, piles that are bent, buckled, fabricated without complying with tolerances in the Contract Documents, or piles fabricated with defects that may weaken the pile, as determined by ENGINEER.
3. Replace damaged or misdriven piles as directed by ENGINEER at no additional cost to OWNER. ENGINEER will provide redesign, as required, for corrections required for damaged or misdriven piles. Corrective measures, including cost of redesign, shall be paid by CONTRACTOR via Change Order
    a. When possible, withdraw rejected piles and replace with new piles. Withdrawal method shall be submitted to ENGINEER for approval.
    b. If withdrawal of damaged or misdriven pile is impossible or impractical, cut off pile below the limits of the structure, and install required additional piles and other corrective measures, such as modifications to the cast-in-place concrete pile cap, as required by ENGINEER's redesign.

C. Heaved Piles:
1. Using data provided by CONTRACTOR, ENGINEER will determine whether a driven pile has lifted from its original seat during driving of adjacent piles. If uplift occurs, re-drive affected piles to a tip elevation at least as deep as original tip elevation with a driving resistance at least as great as original driving resistance.

D. Cost of ENGINEER's Redesign:
1. Piling driven incorrectly, or in position other than that shown on the Contract Documents ("out of position"), or that is otherwise defective, shall be corrected as directed by ENGINEER and as described in this Section. For such piles, CONTRACTOR shall pay OWNER for cost of engineering, Resident Project Representative, and inspection services associated with evaluating and correcting incorrectly installed, out-of-position, or defective piles.
2. ENGINEER will record time of ENGINEER and ENGINEER's consultants and expenses required, if any, for evaluating defective piles and redesigning piling, foundations, and other related structural elements and in making revisions to the Contract Documents.
3. Cost of services of ENGINEER and ENGINEER's consultants shall be based on a charge of 3.0 times direct salary cost of each employee and 1.1 times the cost of expenses.

3.6 FIELD QUALITY CONTROL

A. Furnish, install, and load-test piles to verify design pile lengths and loads to be tested by the specified test method indicated by the geotechnical engineer. Provide complete testing materials and equipment as required. Perform tests in presence of ENGINEER.

B. Test piles used for determining lengths of piles may be located, cut off, and become part of the foundation system if test piles comply with requirements of the Contract Documents. Test piles which aren't to be incorporated in the completed structure shall be removed to at least 2 feet below the surface of the ground or the stream bed, and the remaining hole backfilled with earth or other suitable material.

C. Test Piles shall be as shown on the Drawings.

D. Driving Test Piles:
   1. Use test piles of same size and design as required, and drive with appropriate pile driving equipment operating at rated driving energy required for driving permanent piles.
   2. Drive test piles at locations designated by ENGINEER in the same manner as required for permanent piles.

E. Pile Design Load:
   1. Design load per pile shall be as shown on the Drawings.

F. Dynamic Testing of Piles (Bearing):
   1. CONTRACTOR's dynamic pile testing consultant shall perform dynamic pile testing in accordance with ASTM D4945.
   2. Perform dynamic pile testing using a pile driving analyzer (PDA) on three bearing piles. Perform dynamic testing as a minimum during the final five feet of piling driving.
   3. Restrike test piles with concurrent PDA testing after a minimum waiting period as approved by the ENGINEER.
   4. Perform wave equation analysis (two, minimum) using the field-measured data from the three test piles.
   5. CONTRACTOR's dynamic pile testing consultant shall certify that all dynamic testing was performed correctly and submit a signed and sealed written report upon the completion of testing. Submitted dynamic testing report shall include field information required for driving reports under the Submittals Article of this Section, detailed test procedures, dynamic pile test results, including results from wave equation analyses, and provide recommendations for production pile installation.
   6. Dynamic testing report prepared by CONTRACTOR's dynamic pile testing consultant shall be submitted for review by the ENGINEER not less than 10 days prior to commencing production pile Work.
   7. Based on observations and results of dynamic testing, ENGINEER will indicate minimum pile tip elevations or blow count criteria to be used during driving of production piles.

G. Static Test Loads:
   1. Static tension, compression, and lateral test load for individual piles shall be two times the required design load.

H. Static Compression Load Testing:
   1. Load and test piles to determine and record the load-movement relationship of the test piles under vertical compression load complying with ASTM D1143/D1143M.
   2. Apply compression load by hydraulic jacks acting against anchored reaction frame. Testing apparatus shall comply with ASTM D1143/D1143M. Provide the necessary framing at each

load test to allow ENGINEER unrestricted safe access to pile instrumentation at all times during the load test. Hydraulic jacks, gauges, transducers, and load cells shall comply with ASTM D1143/D1143M. Submit certified calibration curve for the jack and gauge to be used in the testing.

3. Apply minimum specified test load in accordance with Procedure B of ASTM D1143/D1143M.
4. Record pile movement using a reference system constructed independently of the pile and loading apparatus and firmly embedded in the ground at locations clear of load supports, and clear of the zone of influence of the pile loadings and reaction supports. Apparatus for measuring movement shall comply with ASTM D1143/D1143M. Provide equipment and personnel required to obtain the level observations required by the Contract Documents.
5. Protect load test set-up from inclement weather by tarpaulins and protective ditches and, if protection from freezing weather is necessary, provide temporary space heaters.

I. Static Tension Load Testing:
1. Load and test piles to determine and record the load-movement relationship of the test piles under vertical tension load in accordance with ASTM D 3689.
2. Apply tensile load by hydraulic jacks supported on test beams. Testing apparatus shall comply with ASTM D3689. Provide necessary framing at each load test to allow ENGINEER unrestricted safe access to pile instrumentation at all times during load test. Hydraulic jacks, gauges, transducers, and load cells shall comply with ASTM D3689. Submit certified calibration curve for the jack and gauge to be used during testing.
3. Apply the minimum specified test load in accordance with Procedure B of ASTM D3689.
4. Record pile movement using a reference system constructed independently of the pile and loading apparatus and firmly embedded in the ground at locations clear of load supports, and clear of zone of influence of pile loadings and reaction supports. Apparatus for measuring movement shall comply with ASTM D3689. Provide equipment and personnel necessary to obtain the level observations required by the Contract Documents.
5. Protect load test set-up from inclement weather by tarpaulins and protective ditches and, if protection from freezing weather is necessary, provide temporary space heaters.

J. Static Lateral Load Testing:
1. Load and test piles to determine and record the load-movement relationship of test piles under lateral load, complying with ASTM D3966.
2. Apply lateral load by hydraulic jacks acting against a reaction system. Testing apparatus shall comply with ASTM D3966. Provide the necessary framing at each load test to allow ENGINEER unrestricted safe access to pile instrumentation at all times during load test. Hydraulic jacks, gauges, transducers, and load cells shall comply with ASTM D3966. Submit certified calibration curve for the jack and gauge to be used during testing.
3. Test piles as free-head piles. Apply minimum specified test load in accordance with Procedure A of ASTM D3966. Direction of test for the H-piles shall be in the weak axis.
4. Record pile movement using reference system constructed independently of the pile and loading apparatus, firmly embedded in the ground at locations clear of load supports and clear of zone of influence of pile loadings and reaction supports. Apparatus for measuring movement shall comply with ASTM D3966. Provide equipment and personnel necessary to obtain the level observations required by the Contract Documents.
5. Protect load test set-up from inclement weather by tarpaulins and protective ditches and, if protection from freezing weather is necessary, provide temporary space heaters.

K. Static Load Test Reports:

1. Prepare reports for each test pile. Reports shall indicate results of load testing and include all field information required for pile driving reports under the Submittals Article of this Section.

L. Static Load Test Acceptance Criteria:
   1. Static tests shall be acceptable when results indicate compliance with acceptance criteria in the International Building Code, Section 1810.3.3.1.3, Load Test Evaluation Methods.

M. Engage an independent testing and inspection agency to inspect welded splices and to perform tests and prepare test reports.
   1. Testing agency shall conduct and interpret tests, prepare and state in each report of results whether test specimens comply with the Contract Documents and specifically state all deviations.
   2. Welded splices: Notify testing agency three days in advance of starting driving operations. Testing agency will be present on Site for the first day of driving operations to visually inspect field welded splices. Frequency and number of subsequent visits shall be determined by ENGINEER.
      a. Where visually-defective welds are evident, further test welds using non-destructive methods. If welds are determined to be acceptable, CONTRACTOR shall pay for non-destructive testing. When welds are defective, CONTRACTOR shall pay for non-destructive testing.
      b. Correct, or remove and replace, defective Work as directed by ENGINEER.
      c. CONTRACTOR shall pay for corrections and subsequent tests required to determine weld compliance with the Contract Documents.

N. Prior to pile driving, test the coating system for presence of holidays. Use low-voltage holiday detector of less than 90 volts in accordance with manufacturer's instructions.
   1. If holidays are detected, repair by surface treatment and application if additional paint in accordance with paint system manufacturer's recommendations. Retest coating after repair.
   2. After repair of holidays, measure dry film thickness using magnetic dry film thickness gauge in accordance with ASTM D7091 and ASTM E376.

END OF SECTION

SECTION 32 12 00

FLEXIBLE PAVING

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install flexible, hot-mix, hot-laid, asphalt concrete pavement.
   2. The Work includes:
      a. Preparation such as saw cutting, milling where shown or indicated, cleaning, and other preparation for installing flexible pavements.
      b. Providing asphalt concrete paving materials.
      c. Providing tack coat material.
      d. Providing pavement markings where shown or indicated.
      e. Providing quality controls and testing.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before flexible paving Work.

C. Related Sections:
   1. Section 31 23 05, Excavation and Fill.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. AASHTO M320, Specification for Performance-Graded Asphalt Binder.
   2. AASHTO MP1a, Specification for Performance-Graded Asphalt Binder.
   3. AI MS-2, Mix Design Methods for Asphalt Concrete and Other Hot-Mix Types.
   4. ASTM C1371, Test Method for Determination of Emittance of Materials Near Room Temperature Using Portable Emissometers.
   5. ASTM C1549, Test Method for Determination of Solar Reflectance Near Ambient Temperature Using a Portable Solar Reflectometer.
   6. ASTM D242/D242M, Specification for Mineral Filler For Bituminous Paving Mixtures.
   7. ASTM D692/D692M, Standard Specification for Coarse Aggregate for Bituminous Paving Mixtures.
   8. ASTM D946/D946M, Specification for Penetration-Graded Asphalt Cement for Use in Pavement Construction.
   9. ASTM D977, Specification for Emulsified Asphalt.
   10. ASTM D1073, Specification for Fine Aggregate for Bituminous Paving Mixtures.
   11. ASTM D1188, Test Method for Bulk Specific Gravity and Density of Compacted Bituminous Mixtures Using Coated Samples.
   12. ASTM D2726, Test Method for Bulk Specific Gravity and Density of Non-Absorptive Compacted Bituminous Mixtures.
   13. ASTM D2950, Test Method for Density of Bituminous Concrete in Place by Nuclear Methods.
   14. ASTM D3549, Test Method for Thickness or Height of Compacted Bituminous Paving Mixture Specimens.

15. ASTM D6690, Specification for Joint and Crack Sealants, Hot Applied, for Concrete and Asphalt Pavements.
16. ASTM E329, Specification for Agencies Engaged in Construction Inspection and/or Testing.
17. ASTM E408, Test Methods for Total Normal Emittance of Surfaces Using Inspection-Meter Techniques.
18. ASTM E1918, Test Method for Measuring Solar Reflectance of Horizontal and Low-Sloped Surfaces in the Field.
19. ASTM E1980, Practice for Calculating Solar Reflectance Index of Horizontal and Low-Sloped Opaque Surfaces
20. FS TT-P-115, Paint, Traffic, Highway, White and Yellow.
21. South Carolina Department of Transportation (SCDOT) Qualified Products Listings for Construction and Maintenance Materials.
22. South Carolina Department of Transportation Standard Specifications for Highway Construction.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Asphalt Concrete Production Facility:
      a. Production facility for asphalt concrete, tack coat materials, and other bitumastic materials shall be certified by the SCDOT for furnishing such materials for SCDOT highways.
   2. CONTRACTOR’s Testing Laboratory:
      a. Retain the services of independent testing laboratory to perform testing and determine compliance with the Contract Documents of the materials provided under this Section.
      b. Do not employ the same laboratory hired by OWNER for field quality control testing under the “Field Quality Control” Article of this Section.
      c. Testing laboratory shall comply with ASTM E329 and requirements of Section 01 45 29, Testing Laboratory Services.
      d. Testing laboratory shall be experienced in the types of testing required.
      e. Selection of testing laboratory is subject to ENGINEER's acceptance.

B. Regulatory Requirements:
   1. Reference Specifications and Details:
      a. Comply with applicable requirements of SCDOT Standard Specifications for Highway Construction or other Authorities Having Jurisdiction where the Work takes place.
   2. Obtain required highway and street rights-of-way work permits.
   3. Jurisdiction:
      a. Paved areas to be constructed are jurisdiction of OWNER or SCDOT.

C. Quality Assurance Testing:
   1. Quality assurance testing is in addition to source quality control testing, when required, and field quality control testing required under Article 3.4 of this Section.
   2. Materials used in the Work may require testing and retesting, as directed by ENGINEER, during the Project. Allow free access to material stockpiles and facilities at all times. Tests not specifically indicated to be performed at OWNER's expense, including retesting of rejected materials and installed Work, shall be performed at CONTRACTOR’s expense.
   3. CONTRACTOR’s Quality Assurance Testing Laboratory Scope:
      a. Use of testing laboratory shall not relieve CONTRACTOR of responsibility for providing materials and the Work in compliance with the Contract Documents.

b. Quality assurance testing laboratory shall perform the following, unless evidence of material compliance with reference specifications indicated in Paragraph 1.3.B of this Section, is submitted to ENGINEER by CONTRACTOR and asphalt concrete production facility:
   1) Test in accordance with reference specifications indicated in Article 1.3 of this Section. In lieu of quality assurance testing submit evidence and certification of material compliance with reference specifications. When evidence of conformance submitted is not acceptable to ENGINEER, perform quality assurance testing.

c. To facilitate testing services, CONTRACTOR shall:
   1) Secure and deliver to testing laboratory and ENGINEER (when requested by ENGINEER) representative Samples of materials that CONTRACTOR proposes to furnish and that are required to be tested.
   2) Furnish such labor as is necessary to obtain and handle Samples at the Site or at asphalt concrete production facility and other material sources.
   3) Advise testing laboratory and ENGINEER sufficiently in advance of operations to allow for completion of quality assurance tests and for the assignment of personnel.

1.4 SUBMITTALS

A. The Submittals required in 1.4.B and 1.4.C apply to non-SCDOT work. Any work involving SCDOT roads are subject to SCDOT submittal procedures.

B. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Submit the proposed asphalt concrete mix design for each asphalt concrete material, and other bituminous materials, required under this Section, providing complete data on materials, including location in the Work, source, material content and percentages, temperatures and all other pertinent data. Indicate proportion of bituminous material from reclaimed asphalt pavement.
      b. Proposed gradation for each aggregate to be used in flexible paving. Submit gradation test results for the same material furnished on a previous project. Indicate the proportion of reclaimed asphalt pavement.
      c. In lieu of the information required under Paragraphs 1.4.B.1.a and 1.4.B.1.b, above, submit certificates of compliance with the reference specifications indicated in Part I of this Section, for each for the following:
         1) Each mix design required.
         2) Bituminous materials required.
         3) Aggregates to be used in flexible paving, from each material source and each required gradation.
         4) Density of uncompacted asphalt concrete material.
         5) Density of previously-compacted, previously-tested asphalt concrete material.
         6) Density and voids analysis for each asphalt concrete material test specimen.
         7) Evidence of asphalt concrete plant inspection and compliance with the reference specifications indicated in Part I of this Section.
         8) Proportion of reclaimed asphalt pavement in bituminous materials and aggregate.
   2. Product Data:
      a. Manufacturer's complete product data on all pavement marking materials proposed for use, including product literature, specifications, and recommended application techniques and other installation data.

C. Informational Submittals: Submit the following:
   1. Quality Assurance Test Data Submittals and Source Quality Control Submittals:
      a. Submit for quality assurance tests and source quality control tests required.
   2. Delivery Tickets:
      a. Submit copy of delivery ticket for each load of asphalt concrete, tack coat materials, and other materials obtained from asphalt concrete production facility, signed by CONTRACTOR
   3. Field Quality Control Submittals:
      a. Submit results of required field quality control testing.
   4. Qualifications:
      a. Asphalt concrete production facility, when required by ENGINEER.
      b. CONTRACTOR's testing laboratory, when required by ENGINEER.

1.5 SITE CONDITIONS

A. Weather Limitations:
   1. Temperature:
      a. For base course and binder course paving lifts equal to or greater than two inches thickness, atmospheric temperature shall be 40 degrees F and rising.
      b. For surface course paving or other pavement courses in lifts less than two inches thick, temperature of surface on which pavement is to be placed shall be 50 degrees F or greater.
   2. Prohibitions:
      a. Do not place flexible paving materials when weather is foggy or during precipitation.
      b. Do not place flexible paving materials when the base on which the material will be placed contains moisture in excess of optimum.
      c. Place flexible paving materials only when ENGINEER concurs that weather conditions are suitable.

PART 2 PRODUCTS

2.1 SYSTEM PERFORMANCE

A. System Description:
   1. Provide subbase course of the thickness shown on the Drawings, in accordance with Section 31 23 05, Excavation and Fill.

2.2 ASPHALT CONCRETE MIXES

A. Asphalt Concrete Mixtures: Provide the following materials designed and manufactured in accordance with reference specifications indicated in Part I of this Section:
   1. Base Course: Comply with Section 309 of SCDOT Standard Specifications for Highway Construction.
   2. Binder Course: Comply with Section 402 of SCDOT Standard Specifications for Highway Construction and obtain from sources listed on the most recent edition of SCDOT Qualified Products List 37.
   3. Surface Course (Wearing Course, Top Course): Comply with Section 403 of SCDOT Standard Specifications for Highway Construction.

2.3 BITUMINOUS MATERIALS

A. Bituminous Materials for Asphalt Concrete:
   1. Bituminous materials for asphalt concrete shall comply with Section 401 of the SCDOT Standard Specifications for Highway Construction, for the asphalt concrete mixes specified.

2.4 AGGREGATES IN FLEXIBLE PAVEMENTS

A. Aggregates for Asphalt Concrete – General:
   1. Aggregate materials used in flexible pavement shall be in accordance with Section 401 of the SCDOT Standard Specifications for Highway Construction, for the asphalt concrete mix designs indicated.

2.5 PAVEMENT MARKING MATERIALS

A. Material: Pavement marking materials shall be in accordance with Section 625 for fast dry waterborne paint markings, Section 626 for epoxy pavement markings, and Section 627 of the SCDOT Standard Specifications for Highway Construction for thermoplastic pavement markings.

B. Colors:
   1. Roadway Center Markings Between Opposing Traffic Lanes: Yellow.
   2. Roadway Side Striping: White, unless otherwise shown or specified. On roads with divided median, right-side striping of each direction shall be white, and left-side striping shall be yellow.
   3. Roadway Miscellaneous Lane Markings (turn lane arrows and text): White.
   4. No-Parking Areas: Yellow.
   5. Handicap Parking Spaces: Unless otherwise indicated with signs, provide handicap symbol on pavement with white paint on blue background.

PART 3 EXECUTION

3.1 INSPECTION

A. Examine the subbase and base on which flexible paving will be installed. Notify ENGINEER in writing of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions are corrected.

B. Do not place materials on subgrades, or subbase that is muddy or has water thereon.

3.2 PREPARATION

A. Preparation: Before starting installation of flexible paving, perform the following:
   1. Grade Control: Establish and maintain throughout flexible paving installation the required lines and grades, including crown and cross-slope for each asphalt concrete course during construction operations.

2. Prepare subgrade and provide subbase for flexible pavement in accordance with Section 31 23 05, Excavation and Fill. Before installing flexible pavement, obtain ENGINEER's concurrence that subgrade and subbase are suitable for installing flexible pavement.
3. Coordinate placement of flexible pavement with York County Ordinance No. 154 and the Work including drainage structures, manholes, valve boxes, and similar items.
4. Provide appropriate maintenance and protection of traffic measures during placement of pavement.

B. Milling:
1. Perform milling of existing pavement where shown or indicated.
2. "Milling" consists of the milling, shaping, and removing portions of existing surfaces by cold milling process and subsequent cleaning.
3. Milling Equipment:
   a. Milling machines shall be power-operated, self-propelled machines capable of removing the desired thickness of existing surfaces. Machines shall have sufficient power, traction, and stability to accurately maintain depth of cut and slope. Machines shall produce a finished profile and cross slope to within 1/4 inch of that required and shall produce uniform surface texture free of gouges and ridges greater than 3/8-inch deep.
   b. Machines shall be equipped with a means to control dust and other particulate matter created by the cutting action.
   c. Provide equipment that removes milled material as quickly as the rate of milling.
   d. Use vacuum trucks, street sweepers or power brooms to clean milled surfaces.
4. Milling Operations:
   a. Perform milling to so that, when final course of pavement is placed, required elevations and grades are provided. Where required, establish a taut reference string line to control line and grade of milling.
   b. Minimize the time between milling and placement of pavement over milled surface.
   c. Areas not accessible to the milling machine, such as around or adjacent to drainage structures, manholes, curbs, and transverse joints on structures, may be removed by a small milling machine, handwork or other method acceptable to ENGINEER.
   d. Remove milled material as soon as it is milled. Remove fines and other material prior to opening milled area to traffic. Control objectionable dust emissions. When traffic has been allowed into milled area or when more than 48 hours have elapsed since milling, clean the milled area again prior to applying tack coat.
   e. Maintain drainage to drainage inlets and other drainage structures in a manner acceptable to ENGINEER.
   f. Properly dispose of milled material at a location away from the Site.

C. Surface Preparation:
1. Repair surface defects in existing pavement to provide uniform surface to receive new pavement.
2. Provide crack sealant to completely fill cracks more than 1/16-inch wide in areas shown or indicated on the Drawings.
3. Clean existing surfaces over which asphalt concrete pavement will be installed, by removing from the surface foreign material, excess asphalt concrete, excess joint sealant, and crack filler, and other undesirable matter.
4. Provide tack coat as indicated in Part 3 of this Section.

3.3 INSTALLATION OF FLEXIBLE PAVING

A. General:
   1. Provide final pavement surfaces of uniform texture, at required grades and cross-sections.
   2. Construct roadways to the lines, grades, and typical sections shown or indicated.

B. Installation of Asphalt Concrete:
   1. Asphalt concrete mixture shall be transported to the site of paving and placed as soon as possible after mixing.
   2. Placement of each asphalt concrete course shall be completed over the full width of the section under construction during each day's paving operations.
   3. Spread and finish asphalt concrete courses by means of self-propelled mechanical spreading and finishing equipment. Compacted thickness of layers placed shall not exceed 150 percent of specified thickness unless approved in writing by ENGINEER.
   4. Compaction:
      a. Rollers:
         1) Use sufficient rolling equipment to satisfactorily compact and finish the quantity of asphalt concrete placed. There shall be not less than two rollers on the Project at all times. When acceptable to ENGINEER, one of the rollers may be a pneumatic-tire roller.
         2) During rolling operations, roller speed shall not exceed three miles per hour. When sufficient number of rollers is not available, reduce the quantity of asphalt concrete placed to accommodate the available rollers' speed.
         3) Required rollers shall be at the Site, in acceptable operating condition, prior to placing of asphalt concrete.
         4) Use of vibratory rollers in lieu of steel-wheeled rollers is acceptable, however when thickness of asphalt concrete is one-inch or less, rolling shall be in the static mode.
      b. Rolling of initially-placed asphalt concrete material, or breakdown rolling, shall begin as soon as the asphalt concrete mixture will bear the roller without undue displacement.
      c. Rolling shall be longitudinal, overlapping on successive trips by not less than one-half roller rear wheel width, and not more than three-quarters of roller rear wheel width. Alternate trips of the roller shall be of slightly different lengths.
      d. At all times, roller motion shall be slow enough to avoid displacing the asphalt concrete.
      e. Operate rollers continuously from breakdown of laid asphalt concrete through finish rolling.
      f. Perform finish rolling using a steel-wheeled roller or a vibratory steel-wheel roller operating in the static mode.
      g. Perform rolling with consecutive passes to achieve even and smooth finish without roller marks.
      h. At each location not accessible to roller, thoroughly compact asphalt concrete with tampers and finish, where necessary, with a hot smoothing iron to provide uniform, smooth layer over the entire area so compacted.
   5. Each compacted asphalt concrete course shall be within plus or minus 1/4-inch of the indicated thickness.
   6. Placement of Adjacent Strips of New Asphalt Concrete:
      a. When more than one width of asphalt concrete material will be placed, a six-inch wide strip of asphalt concrete adjacent to the area on which the future material is to be placed shall not be rolled until such future material is placed.
      b. Do not leave the unrolled strip unrolled for more than two hours after placement, unless the six-inch unrolled strip is first heated with a joint heater.

c. After the first strip or width of asphalt concrete is compacted, place, finish, and compact the second width or strip as required for the first width, except that rolling shall be extended to include the six-inch strip of the first width not previously compacted.

C. Construction Joints:
1. Construction joints shall be made in such a manner as to ensure a neat junction, thorough compaction, and bond throughout.
2. Provide a transverse joint extending over the full width of the strip being laid and at right angles to its centerline at end of each workday and at other times when the placement of hot-mix asphalt concrete will be suspended for a period of time that will allow asphalt concrete mixture to chill.
3. Thoroughly compact by rolling the forward end of a freshly laid strip of asphalt concrete before the asphalt concrete mixture becomes chilled. When the Work is resumed, the end shall be cut vertically for the full depth of the layer.

D. Joining of Pavements:
1. When pavement is to join existing or previously-laid pavement, the existing or previously-laid pavement shall be neatly and carefully edged to allow for overlapping and feathering of the subsequent course of asphalt concrete material.
2. Where new pavement is to meet existing pavement, the existing pavement shall be sawcut and notched.
3. Where new pavement will meet existing asphalt pavement, remove existing pavement 12 inches onto undisturbed existing pavement course at edges where new pavement will meet existing pavement.
4. Tack Coat:
a. Provide tack coat material at the following locations:
1) At edges where new pavement will connect to existing or previously-installed pavement.
2) On surface of existing or previously-installed pavement course over which new pavement will be installed, prior to placement of the subsequent pavement course. Tack coat may be deleted when a succeeding layer of asphalt pavement is being applied over a freshly-placed asphalt pavement course that has been subjected to very little or no traffic, with approval of ENGINEER
3) Where new pavement will abut curbing, concrete gutters, drainage structures and frames, manhole cover frames, valve boxes, and similar items.
b. Tack Coat Installation: Install tack coat immediately prior to installing pavement. Place pavement while tack coat is wet. Apply tack coat in accordance with reference specifications indicated in Part I of this Section.

E. Curing:
1. Do not allow traffic onto pavement until directed by ENGINEER. Traffic will not be allowed on new asphalt concrete pavement until surface temperature is less than 140 degrees F.
2. Hold construction traffic on new pavement to a minimum as acceptable to ENGINEER.

F. Asphalt Concrete Curbs: Provide extruded asphalt curbs of the height and profile indicated on the Drawings.

G. Defective Pavement Work:

1. When directed by ENGINEER, remove and replace defective flexible paving Work. Cut out such areas of defective pavement and fill with fresh asphalt concrete materials, compacted to required density.

3.4 ADJUSTING

A. Frames and Covers:
   1. Set frames of drainage structures, manholes, valve boxes, and similar items to final grade. Adjust frames of existing structures and frames furnished under other Sections. Frames shall be substantially similar elevation to finished surface course of pavement.
   2. Replace covers and gratings of existing structures immediately following adjusting associated frames. Install covers and gratings of structures provided under the Project as quickly as possible.
   3. Where there is a delay between adjusting of frames and installation of surface course, provide temporary bituminous material around perimeter of each frame to smooth vehicle access over the frame. Maintain and repair temporary bituminous material as required until placement of surface course. Remove temporary bituminous material before installing surface course.

B. Pavement Adjustment:
   1. Repair or replace in manner acceptable to ENGINEER areas of pavement that are observed to pond or collect water.

3.5 CLEANING

A. Cleaning: After completing the paving operations, clean surfaces of excess or spilled bituminous materials, excess asphalt concrete, and foreign matter.

3.6 PROTECTION

A. Protect finished pavement until pavement has become properly hardened and cool.

B. Cover openings of drainage structures, manholes, valve boxes, and similar items in the paved area until permanent coverings are provided.

3.7 PAVEMENT MARKINGS

A. Pavement Markings: Provide pavement markings where shown or indicated.
   1. Preparation:
      a. Sweep surface with power broom supplemented by hand brooms to remove loose material and dirt.
      b. Do not begin marking bituminous concrete pavement until approved by ENGINEER.
      c. When reflective glass beads are required, mix with paint prior to paint application.
   2. Application:
      a. Using mechanical equipment, provide uniform, straight edges in two separate coats. Apply in accordance with paint manufacturer's recommendations.

END OF SECTION

SECTION 32 92 00

LAWNS AND MEADOWS

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, tools, equipment and incidentals as shown, specified and required to furnish and install all lawns and meadows.
   2. Extent of lawns and meadows is shown.
   3. Types of products required include the following.
      a. Topsoil.
      b. Lawn grass seed.
      c. Meadow grass seed mixture.
      d. Wildflower meadow seed mixture.
      e. Inorganic soil amendments.
      f. Organic soil amendments.
      g. Fertilizers.
      h. Mulches.
      i. Erosion-control materials.
      j. Accessories.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with, or before, lawns and meadows.

C. Related Sections:
   1. Section 31 11 00, Clearing and Grubbing.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. Association of Official Analytic Chemists, (AOAC).
      a. Official Methods of Analysis of AOAC International.
   2. Association of Official Seed Analysts, (AOSA).
      a. Journal of Seed Technology; Rules for Testing Seeds.
   3. American Society of Agronomy, (ASA).
      a. Reference No. 1 - Methods of Soils Analysis, Soil Science Society of America, Incorporated.
   4. American Society for Testing and Materials, (ASTM).
      a. ASTM B 221, Specification for Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles and Tubes.
      b. ASTM C 602, Specification for Agricultural Liming Materials.
      c. ASTM D 75, Practice for Sampling Aggregates.
      d. ASTM D 977, Specification for Emulsified Asphalt.
      e. ASTM D 2487, Practice for Classification of Soils for Engineering Purposes (United Soil Classification System).
      f. ASTM D 5268, Specification for Topsoil Used for Landscape Purposes.

g. ASTM E 329, Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection.

5. South Carolina Department of Transportation (SCDOT).
   a. Qualified Products List 88.
   b. Supplemental Technical Specification SC-M-810-4.
6. South Carolina Department of Health and Environmental Control (SCDHEC) Storm Water Management BMP Handbook, Appendix C.

1.3 DEFINITIONS

A. The term “finish grade” shall be used to describe the finished surface elevation of planting soil.

B. The term “manufactured topsoil” shall be used to describe soil produced off-Site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil acceptable as a component of loam.

C. The term “loam” shall be used to describe topsoil that has been mixed with additional organic and inorganic additives, as specified.

D. The term “percentage pure live seed” shall be defined as the percent (%) purity multiplied by percent (%) germination divided by 100 to equal the percent pure live seed (PLS) and shall be calculated for all seed lots using each seed lots own unique purity and germination test results. A PLS pound shall be defined as the bulk weight of seed required to equal one pound of 100 percent pure, germinated seed.

E. The term “subgrade” shall be used to describe the surface of subsoil remaining after completing excavation; or the top surface of a fill or backfill immediately beneath topsoil and which has not been tested for acceptable use as topsoil.

1.4 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Engage a single landscape installer skilled, trained and with successful and documented experience in the planting of lawns and meadows and with specific skill and successful experience in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and successful experience in this type of Work. Submit names and qualifications to ENGINEER along with the following information on a minimum of three successful projects:
      a. Names and telephone numbers of owner, architects or engineers responsible for projects.
      b. Approximate contract cost of the lawns and meadows.
      c. Amount of area installed.
   2. Installer’s Site Supervisor: Require installer to maintain an experienced full-time landscape supervisor on-Site during the time of preparation for, and planting of, lawns and meadows. Supervisor shall have achieved landscape or horticultural certification acceptable to governing authorities having jurisdiction at the Site.
   3. Ratio of laborers to certified landscape supervisors shall not exceed 12 to one. Certified landscape supervisor shall be on-Site throughout the day-to-day performance of the Work of this Section.

4. Application of herbicides, chemicals and insecticides shall be done by personnel licensed to perform such applications by governing authorities having jurisdiction at the Site and in accordance with each manufacturer's instructions provided on each product label.

B. Soil-Testing Laboratory Qualifications:
   1. An independent laboratory, recognized by governing authorities having jurisdiction at the Site, with the experience and capability to conduct testing indicated and that specializes in types of soil tests to be performed.
   2. To qualify for approval, an independent testing agency shall demonstrate to ENGINEER'S satisfaction, based on evaluation of criteria submitted by testing agency, that it has the experience and capability to satisfactorily conduct the testing indicated without delaying the Work, in accordance with ASTM E 329.

C. References: Comply with the applicable references in Article 1.2.

D. Soil Analysis: Furnish report of soil analysis to ENGINEER, prepared by a qualified soil-testing laboratory, stating percentages of organic matter; mechanical gradation of sand, silt, and clay content; cation exchange capacity; sodium absorption ratio; deleterious materials content; pH; and mineral and plant-nutrient content of soil. Chemical analysis shall include tests for percentages of nitrate nitrogen, ammonium nitrogen, phosphorus, potassium, calcium, iron, manganese, copper, zinc, extractable aluminum, and total soluble salts.
   1. Existing On-Site Soil:
      a. Separate soil stockpiled and proposed for use as topsoil for lawns and meadows into 1000 cubic yard piles and label with a numbering system used to reference all soil samples and test results.
      b. Obtain a one cubic foot representative sample for each 1000 cubic yards of soil stockpiled on-Site proposed for use as topsoil for lawns and meadows, in compliance with ASTM D 75 and Appendixes, for securing samples from stockpiles.
      c. Place samples taken from each stockpile, into separate clean, new and previously unused, containers and mix thoroughly. Maintain separation and legible labeling of each sample taken from each stockpile, throughout the process of mixing, drying and delivering to soil analysis laboratory. Label samples on outside of container.
      d. Take one cup of soil from each container and allow to dry at room temperature. Once dry, place each one-cup sample in a separate, accurately labeled, new and previously unused one-cup sized plastic container, seal tightly and deliver to soil testing laboratory.
      e. Report suitability of soil as a topsoil component for lawn and meadow plant growth. State recommended quantities of nitrogen, phosphorus, secondary and micronutrients, potash and soil amendments to be added to produce satisfactory topsoils. Include calculations, types of fertilizer and recommendations for application rates in either gallons or pounds per cubic foot of soil.
      f. In addition, all on-Site soil that will be used as topsoil shall be provided with additional compost and peat moss amendments specified, whether or not testing indicates positive need for such amendments, for such material to be used as loam.
   2. Manufactured Imported Topsoil:

a. Test each 1000 cubic yards of manufactured topsoil at the proposed source. In addition, after ENGINEER'S approval of manufactured topsoil based on results and recommendations of soil testing reports, test each 1000 cubic yards of manufactured topsoil that is delivered to the Site for conformance to results and recommended modifications of approved soil test reports. Manufactured topsoil that differs from proposed source material, after modification according to recommendations of soil test reports, shall be rejected for use in the Work.
b. Obtain a one cubic foot representative sample for each 1000 cubic yards of manufactured topsoil proposed for lawn and meadow Work, in compliance with ASTM D 75 and Appendixes, for securing samples from stockpiles.
c. Place samples taken from each stockpile into separate clean, new and previously unused, containers and mix thoroughly. Maintain separation and legible labeling of each sample, taken from each stockpile, throughout the process of mixing, drying and delivering to soil analysis laboratory. Label samples on outside of container.
d. Take one cup of topsoil from each container and allow to dry at room temperature. Once dry, place each one-cup sample in a separate, accurately labeled, new and previously unused one-cup sized plastic container, seal tightly and deliver to soil testing laboratory.
e. Report suitability of manufactured topsoil as a component for lawn and meadow plant growth. State recommended quantities of nitrogen, phosphorus, secondary and micronutrients, potash and soil amendments to be added to produce satisfactory manufactured topsoil. Include calculations, types of fertilizer and recommendations for application rates in either gallons or pounds per cubic foot of manufactured topsoil.
f. Organic component of manufactured topsoil shall be obtained from compost and peat moss amendments specified, for such material to be used as loam.

E. Source Quality Control:
1. Analysis and Standards: Package all products with manufacturer's certified analysis performed in accordance with methods established by AOAC, wherever applicable, or as specified.
2. Provide manufactured imported topsoil from a commercial processing facility specializing in the manufacture of topsoil.
3. Seed that has been stored at temperatures, or under conditions not recommended by the seed supplier, or has become wet, moldy, or otherwise damaged, shall not be acceptable. The PLS for each seed lot shall be 75 percent, minimum.
4. Certify that all seed has been stored under conditions recommended by the seed supplier and has not been subjected to conditions damaging to PLS percentages.
5. Seed may be mixed by an approved method on-Site or at the seed supplier's facilities. If the seed is mixed on-Site, each variety shall be delivered in the original containers and shall bear the supplier's certified analysis. Where seed is mixed by the seed supplier, provide ENGINEER with the seed supplier's certified statement as to the composition of the mixture.

1.5 SUBMITTALS

A. Action Submittals: Submit the following:
1. Shop Drawings:
a. Schedule for lawn and meadow-planting showing anticipated planting dates for each type of Work.

2. Product Data:
    a. Manufacturer's product data, specifications and installation instructions for all required materials.
    b. Composition and analysis of commercial fertilizers and all purchase receipts showing the total quantity actually purchased for this Project.
    c. Proportions of each component contained in hydro seed mixture. Identify number of pounds of each component required for each 100 gallons of water. Include the number of square feet of lawn, grass meadow or wildflower meadow mixture that can be installed with each full tank of hydro seed mixture.
    d. PLS for each type of seed and each seed lot. Include bulk weight of seed required to equal one pound of 100 percent pure, germinated seed.
3. Samples:
    a. Submit 12-inch by 12-inch sheet of erosion control fabric with manufacturer's selections of standard biodegradable filler papers, and yarns.

B. Informational Submittals: Submit the following:
1. Certificates:
    a. Certification of Grass and Wildflower Seed: For each grass-seed monostand and seed mixture, furnish seed supplier's certification stating the botanical and common name, and percentage by weight of each species and variety, and percentage of purity, germination and weed seed. Include the year of production and date of packaging. Certify that seed has been stored in compliance with all recommendations of the seed supplier.
    b. Certificates of inspection as may be required by governmental authorities to accompany shipments, and manufacturer's certified analysis for soil amendments and fertilizer materials. For standard products submit other data substantiating that materials comply with specified requirements.
2. Test Reports: Submit the following:
    a. Soil analysis reports for existing soil and imported manufactured topsoil, as specified. Include recommendations for remediating existing soil into acceptable topsoil.
3. Qualifications Data: Submit qualifications data for the following:
    a. Landscape installer.
    b. Landscape supervisor.
    c. Testing agency.
4. Source Quality Control Submittals
    a. Written statement providing the location from which manufactured topsoil is to be obtained and the names and addresses of the suppliers.

C. Closeout Submittals: Submit the following:
1. Operations and Maintenance Data:
    a. Submit recommended procedures to be established by OWNER for the maintenance of lawns and meadows for one full year. Submit prior to expiration of required maintenance period.
2. Warranty Documentation:
    a. Submit written warranty, signed by CONTRACTOR and landscape installer, as specified.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Delivery of Materials:
   1. Do not deliver seed until Site conditions are ready for installation.
   2. Deliver packaged materials in containers showing weight, analysis and name of manufacturer. Protect materials from deterioration during delivery.
   3. Deliver seed in undamaged, original containers, sealed by the supplier and indicating compliance with approved Shop Drawings.
   4. Inspect lawn and meadow materials upon arrival at Site. Immediately and permanently remove unacceptable materials from Site.

B. Storage of Materials:
   1. Store and cover materials to prevent deterioration. Remove packaged materials that become wet or show deterioration or water marks from the Site.
   2. Seed that becomes wet, moldy or damaged during the time of storage on-Site or that has been damaged during transit is not acceptable.

1.7 PROJECT CONDITIONS

A. Environmental Requirements:
   1. Proceed with and complete lawn and meadow planting as rapidly as portions of the Site become available, working within the seasonal limitations for each type of lawn, grass and wildflower planting required.
   2. Proceed with planting only when current and forecasted weather conditions are favorable to successful planting and establishment of lawns and meadows.
      a. Do not spread seed when wind velocity exceeds five miles per hour.
      b. Do not plant when drought, or excessive moisture, or other unsatisfactory conditions prevail.
   3. Herbicides, chemicals and insecticides shall not be used on areas bordering wetlands.

B. Scheduling:
   1. Coordinate planting with specified extended service periods to provide required service from date of Substantial Completion. Plant during one of the following periods:
      a. Permanent Seeding:
         1) Comply with recommendations of supplier.
      b. Temporary Seeding:
         1) Comply with recommendations of supplier.
   2. Do not begin lawn and meadow planting until water, acceptable for use and adequate in supply, is available on-Site and can be successfully transported to the areas of Work. Coordinate provision of adequate and acceptable water supply with Project Schedule.
   3. Do not proceed with installation of loam until all subgrade utility services have been installed, are operating successfully and have been approved by ENGINEER.

C. Pre-installation Conference:
   1. Prior to commencement of lawn and meadow planting and associated Work, CONTRACTOR shall schedule and meet at the Site with the landscape installer, the installers of other Work in and around lawn and meadow areas that follows the lawn and meadow Work, including fencing Work; and ENGINEER and other representatives directly concerned with performance of the Work. Review foreseeable methods and procedures related to the lawn and meadow Work, including the following:
      a. Review Project requirements and the Contract Documents.

b. Review required submittals, both completed and yet to be completed.
c. Review availability of water and methods of delivery.
d. Review status of below-grade work and required access during lawn and meadow planting and establishment.
e. Review Project Schedule and availability of materials, tradesmen, equipment and facilities needed to make progress and avoid delays.
f. Review environmental conditions, other Project conditions, and procedures for coping with unfavorable conditions.
g. Review procedures required for protection of lawns and meadows during the remainder of the construction period.
h. Review required inspection, testing, and certifying procedures.

2. Record the discussions of the Pre-installation Conference and the decisions and agreements or disagreements reached, and furnish a copy of the record to each party attending.
3. Record all revisions or changes agreed upon, reasons therefor, and parties agreeing or disagreeing with them.
4. Reconvene the meeting at the earliest opportunity if additional information must be developed in order to conclude the subjects under consideration.

1.8 WARRANTY

A. General Warranty: The special warranties specified in this Article shall not deprive OWNER of other rights or remedies OWNER may otherwise have under the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by CONTRACTOR under the Contract Documents.

B. Special Warranties: Warranty lawns and meadows through the specified extended service period.

1.9 EXTENDED SERVICE

A. Extended Lawn Service:
1. Begin extended service immediately after each lawn area is acceptably established. Provide extended service for not less than the following periods:
2. Seeded Lawns: Sixty days from date after lawn areas are acceptably established.
a. When full service period has not elapsed before end of planting season, or if lawn is not acceptably established, continue service during next planting season.
3. Service lawn by watering, fertilizing, weeding, mowing, trimming, replanting, and other operations. Roll, regrade, and replant bare or eroded areas and remulch to produce a uniformly smooth lawn.
a. In areas where mulch has been disturbed by wind or extended service operations, add new mulch. Anchor as required to prevent displacement.
4. Watering: Provide and maintain temporary piping, hoses, and lawn-watering equipment to convey water from sources. Keep newly germinated plants uniformly moist to a depth of 4-inches, applied at a minimum rate of 1-inch per week, or greater as required to maintain minimum moisture depth specified. Provide and maintain watering gages and soil moisture probes until end of maintenance period.
a. Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly planted areas.

b. After plants have their first true leaves and grasses show mature blades, watering shall be performed to provide moisture to a depth of 6-inches, and not performed again until top 1-inch of loam has dried.

5. Mow lawn as soon as top growth is tall enough to cut. Repeat mowing to maintain specified height without cutting more than 40 percent of grass-leaf height. Remove no more than 40 percent of grass-leaf growth in initial or subsequent mowing. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet. Schedule initial and subsequent mowing to maintain the following grass height:
   a. Bent Grass: Mow to 1/2-inch high or less.
   b. Bermuda Grass: Mow 1/2 to 1-inch high.
   c. Carpet, Centipede, Perennial Rye and Zoysia Grasses: Mow 1 to 2-inches high.
   d. Kentucky Bluegrass and Buffalo, Annual Rye and Chewings Red Fescue Grasses: Mow 1-1/2 to 2-inches high.
   e. Bahia, Turf-Type Tall Fescue and St. Augustine Grasses: Mow 2 to 3-inches high.
6. Lawn Fertilization: Apply fertilizer after initial mowing and when grass is dry.
   a. Use fertilizer that will provide actual nitrogen of at least one pound for each 1000 square feet of lawn area.
7. After seed has passed its expected germination period, reseed all areas and parts of areas that fail to show a uniform stand of grass. Reseed repeatedly until all areas are covered with grass.

B. Extended Meadow Service:
1. Begin extended service immediately after each meadow area is satisfactorily established and continue for not less than 40 days.
2. Service meadow by watering, weeding, replanting, and other operations. Roll, regrade, and replant bare or eroded areas and remulch.
3. Watering: Provide and maintain temporary piping, hoses, and meadow- watering equipment to convey water from sources. Keep meadow uniformly moist to a depth of 6-inches. Provide and maintain watering gages and soil moisture probes until end of maintenance period.
   a. Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly planted areas.
   b. Water meadow at a rate in accordance with supplier's written recommendations. Water at controlled rates that are less than the rate at which the soil can absorb water to prevent runoff.
   c. After plants have their first true leaves and grasses show mature blades, perform watering to provide moisture to a depth of 8-inches, and do not perform again until top 1-inch of loam has dried.

PART 2 PRODUCTS

2.1 MATERIALS

A. Topsoil:
1. All soil accepted as topsoil, whether obtained from on-Site or off-Site sources, shall comply with specified topsoil analysis.

2. Provide fertile, friable, natural loam, surface soil, capable of sustaining vigorous plant growth; free of any admixture of subsoil, clods of hard earth, plants or roots, sticks, stones larger than 1-inch in diameter, or other extraneous material harmful to plant growth, in compliance with ASTM D 5268. Provide topsoil with the following analysis:
    a. 3/4-inch mesh: 100 percent passing.
    b. No. 4-sieve: 90 to 100 percent passing.
    c. No. 200-sieve: 0 to 10 percent passing.
    d. Clay content of material passing No. 200-sieve not greater than 60 percent, as determined by hydrometer tests.
    e. pH-adjusted with ferrous sulphate or ground limestone to provide pH 5.5 to pH 7.0 at time of installation of lawns, grass and meadow areas, unless particular species of grass or wildflower stand requires a different pH to meet its growing needs.
    f. Electrical conductivity of a 1:2 soil-water suspension shall not exceed 1.0 milliohm per centimeter and with less than 200 parts per million of extractable aluminum.
    g. Cation Exchange Capacity: 5, minimum.
    h. Organic content not less than five percent, as determined by ignition loss of oven-dried samples passing No. 10-sieve (Muffle Furnace Temperature: 110 plus or minus five degrees C for eight hours).
    i. Free of pests and pest larvae.
3. Topsoil Source: Reuse surface soil stockpiled on-Site, where possible. Verify suitability of stockpiled surface soil to produce topsoil, as specified. Clean surface soil of roots, plants, sod, stones, clay lumps, and other extraneous materials harmful to plant growth.
    a. Supplement acceptable on-Site soil with manufactured topsoil from off-Site sources, when quantities available on-Site are insufficient to complete the Work.

B. Lawn Grass Seed:
1. Lawn Grass Seed Mixture: Provide fresh, clean, new-crop seed complying with the tolerance for purity and germination established by AOSA. Provide seed of the grass species, proportions and minimum percentages of purity, germination, and maximum percentage of weed seed, specified.
2. Seed Species: Provide seed in compliance with SCDHEC Storm Water Management BMP Handbook Appendix C for turf-type grasses.

C. Meadow Grass Seed:
1. Tall Grassy Meadow with Minor Forbs: Provide a mixture of fresh, clean, new-crop seed complying with the tolerance for purity and germination established by AOSA. Provide seed of each species, proportions and minimum percentages of purity, germination, and maximum percentage of weed seed specified.
2. Seed Species: Provide seed in compliance with SCDHEC Storm Water Management BMP Handbook Appendix C .

D. Wildflower Meadow Seed:
1. Wildflower Meadow with Minor Grasses: Provide a mixture of fresh, clean, new-crop seed complying with the tolerance for purity and germination established by AOSA. Provide seed of each grass and forb species, proportions and minimum percentages of purity, germination, and maximum percentage of weed seed specified.
2. Seed Species: Seed of grass and forb species as follows, with not less than 80.0 percent germination, not less than 80 percent pure seed, and not more than 1.0 percent weed seed by weight:

a. Provide seed in compliance with Table 1 of SC-M-810-4 for legumes.

E. Inorganic Soil Amendments:
   1. Ground Oolitic Limestone: ASTM C 602, agricultural limestone containing a minimum 80 percent calcium carbonate equivalent and as follows:
      a. Class: Class T, with a minimum 99 percent passing through No. 8-sieve and a minimum 75 percent passing through No. 60-sieve.
   2. Perlite: Agricultural-grade, expanded pumice.
   3. Agricultural Gypsum: Commercial-grade and finely ground, containing a minimum of 90 percent calcium sulfate.
   4. Grit Aggregate: Commercial-grade filter sand consisting of hard, durable rounded grains of quartz or other rock that do not compact to a solid mass when wet, with a pH in the range required for topsoil. Provide clean, washed, natural or manufactured aggregate, free of toxic materials, salt and other chemical contamination.

F. Organic Soil Amendments:
   1. Compost: Well-composted, stable, weed-free organic matter, produced by the aerobic decomposition of organic residues; pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through a 1-inch screen; soluble salt content of 5 to 10 decisiemens/meter; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:
      a. Organic Matter Content: 50 to 60 percent of dry weight.
      b. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.
   2. Peat: Partially decomposed stems and leaves of several species of sphagnum moss; finely divided or granular texture. Supply shredded material, free from lumps, wood, roots, stones, decomposed collodial residue and other extraneous foreign matter, capable of passing through a 1/2-inch screen, which can easily be incorporated with the soil. Supply material, which has been conditioned in storage piles after excavation for at least six months, including one freezing and thawing period. Supply peat humus with the following analysis:
      a. Not less than 90 percent organic matter by weight on an ovendry basis.
      b. pH range of 3.4 to 4.8.
      c. Moisture content 35 percent at time of incorporation into soil.
      d. Water absorbing ability 150 percent to 350 percent by weight.
   3. Wood Derivatives: Decomposed, nitrogen-treated sawdust, ground bark, or wood waste; of uniform texture, free of chips, stones, sticks, soil, or toxic materials.
   4. Manure: Well-rotted, unleached, stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, and material harmful to plant growth.

G. Fertilizers:
   1. Bonemeal: Commercial, raw or steamed, finely ground; a minimum of four percent nitrogen and 20 percent phosphoric acid.
   2. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 20 percent available phosphoric acid.
   3. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:

a. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports.

4. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
   a. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified soil-testing agency.

H. Mulches:
1. Straw Mulch: Provide air-dry, clean, mildew- and certified seed-free, salt hay or threshed straw of wheat, rye, oats, or barley.
2. Peat Mulch: Finely divided or granular texture, with a pH range of 6 to 7.5, containing partially decomposed moss peat, native peat, or reed-sedge peat and having a water-absorbing capacity of 1100 to 2000 percent.
3. Compost Mulch: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1-inch screen; soluble salt content of 5 to 10 decisiemens/meter; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:
   a. Organic Matter Content: 50 to 60 percent of dry weight.
   b. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.
4. Fiber Mulch: Biodegradable, dyed-wood, cellulose-fiber mulch; nontoxic; free of plant-growth or germination inhibitors; with maximum moisture content of 15 percent and a pH range of 4.5 to 6.5.
5. Nonasphaltic Tackifier: Colloidal tackifier recommended by fiber-mulch manufacturer for slurry application; nontoxic and free of plant-growth or germination inhibitors.
6. Asphalt Emulsion: ASTM D 977, Grade SS-1; nontoxic and free of plant- growth or germination inhibitors.

I. Erosion-Control Materials:
1. Erosion-Control Blankets: 100 percent biodegradable wood excelsior, straw, or coconut-fiber mat enclosed in a photodegradable plastic mesh. Include manufacturer's recommended 6-inches long steel wire staples.
2. Erosion-Control Fiber Mesh: Biodegradable twisted jute or spun-coir mesh, a minimum of 0.92 pounds per cubic yard, with 50 to 65 percent open area. Include manufacturer's recommended 6-inches long steel wire staples.

J. Accessories:
1. Provide herbicides, chemicals and insecticides as needed for disease, fungus or pest control. All herbicides, chemicals and insecticides shall be bear approval labels indicating they are approved by the United States Department of Agriculture for the intended uses and application rates.
2. Post Emergent Crab Grass and Plantain Chemical: Provide recommended post emergent crab grass and plantain control throughout the maintenance period to ensure germinated and established lawns free of crab grass and other undesirable grasses and forbs.
3. Wood Edging: Of sizes shown, and wood stakes as follows:
   a. Species: All Heart Redwood or Western Red Cedar, All Heart.
   b. Stakes: Same species as edging, 1-inch by 2-inches by 18-inches long in nominal size, with galvanized nails for anchoring edging.

4. Steel Edging: Standard commercial steel edging, rolled edge, fabricated in sections of standard lengths, with loops stamped from or welded to face of sections to receive stakes.
    a. Edging Size: 1/4-inch wide by 5-inches deep.
    b. Stakes: Tapered steel, a minimum of 15-inches long.
    c. Accessories: Standard tapered ends, corners, and splicers.
    d. Finish: Zinc-coated.
    e. Paint Color: Black.
5. Aluminum Edging: Standard-profile extruded-aluminum edging, ASTM B 221, alloy 6063-T6, fabricated in standard lengths with interlocking sections with loops stamped from face of sections to receive stakes.
    a. Edging Size: 3/16-inches wide by 5-1/2-inches deep.
    b. Stakes: Aluminum, ASTM B 221, alloy 6061-T6, approximately 1-1/2- inches wide by 12-inches long.
    c. Finish: Black anodized.
6. Polyethylene Edging: Standard black polyethylene edging, V-lipped bottom horizontally grooved, extruded in standard lengths, with 9-inch steel angle stakes.
    a. Edging Size: 0.07-inch wide by 5-inches deep.
    b. Top Profile: Round top; 1/2-inch diameter.

K. Water: Acceptable for lawn and meadow application and containing no material harmful to plant growth and establishment.

2.2 LOAM MIXES

A. Follow recommendations of soil-testing laboratory for modifying on-Site soil and manufactured soil, for use as topsoil.

B. On-Site soil and manufactured soil that has been provided with all inorganic soil amendments and fertilizers recommended by soil-testing laboratory, and acceptable for use as topsoil, shall be mixed with an additional organic soil amendment mix in a ratio of two parts topsoil to one part organic soil amendment mix, by volume.
    1. Prepare soil amendment mix by combining 40 percent compost, 40 percent peat moss, ten percent wood derivatives, five percent well-rotted manure and five percent grit aggregate, by volume.

C. Loam: Thoroughly blend topsoil with organic soil amendment mix and use as planting media for all lawn and meadow Work.

PART 3 EXECUTION

3.1 INSPECTION

A. Examine the areas and conditions under which lawn and meadow Work is to be performed, and notify ENGINEER, in writing, of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected in a manner acceptable to ENGINEER.

3.2 PREPARATION

A. Thoroughly blend and mix loam before spreading. Incorporate fertilizers, and ground limestone or acidulant, after spreading, as specified, and at rates recommended by soil-testing laboratory.

B. Protect structures, utilities, sidewalks, pavements, and other facilities, trees, shrubs, and plantings from damage caused by planting operations.
   1. Protect adjacent and adjoining areas from hydroseeding overspray.

C. Provide erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

D. Perform percolation tests on existing subgrade and placed fills prior to fine grading.
   1. Perform percolation testing of subgrades and placed fills to determine whether or not the subgrade will drain properly. Perform percolation tests in accordance with the following procedure:
      a. Dig a hole in the subgrade that is 4-inches in diameter and 12-inches deep.
      b. Fill the hole with water and wait for the water to completely drain from the hole.
      c. Immediately refill the hole with water and measure the rate of fall in the water level.
   2. In the event that water drains at a rate less than 1-inch in one hour, excavate soil to a minimum depth of 24-inches, and deeper, as necessary to break the compaction. Backfill, recompact and retest each area so prepared to confirm drainage rates exceed one inch in one hour.
   3. Perform minimum of one soil percolation test for every 10,000 square feet of lawn and meadow area.

E. Excavate or fill subgrade, as required, to bring subgrade to elevations shown. Maintain all angles of repose. Confirm that subgrade is at proper elevations and that no further earthwork is required to bring the subgrade to proper elevations. Provide subgrade elevations that slope parallel to finished grade and towards subsurface drains shown.

F. Remove all construction debris, trash, rubble and all extraneous materials from subgrade. In the event that fuels, oils, concrete washout or other material harmful to plant growth or germination have been spilled into the subgrade, excavate the subgrade sufficiently to remove all such harmful materials and fill with approved fill, compacted to the required subgrade compaction level.

3.3 FINE GRADING

A. Immediately prior to dumping and spreading loam, clean subgrade of all stones greater than 2-inches and all other extraneous matter. Remove all such material from Site. Notify ENGINEER that subgrade has been cleaned, and obtain approval prior to spreading loam.

B. Do not attempt to spread excessively wet, muddy or frozen loam. Do not spread loam more than five days before seeding or planting.

C. Spread loam to a depth of 6-inches but not less than required to meet finish grades after light rolling and natural settlement.
   1. Spread approximately one-half the thickness of required loam depth. After spreading loam, rototill, disk or harrow loam and subgrade to bring top 2-inches of subgrade upward into loam layer, so that there is a transitional layer between loam and subgrade.
   2. Spread remainder of loam to required finish grades.
   3. Compact each lift sufficiently to reduce settling, but not enough to prevent the movement of water and feeder roots through loam. After compaction spread loam should offer firm, even resistance when a soil sampling tube is inserted.
   4. Phase the placement of the final lift so that wheeled vehicles do not have to travel over areas where final lifts are already in-place.
   5. Spread and compact to a smooth, uniform surface plane, to within plus or minus 1/2-inch of finish elevations. Roll and rake and remove all ridges, and fill depressions, as required. Remove all stones larger than 1-inch in any dimension and all sticks, roots, trash and other extraneous matter.
   6. Perform percolation tests as for subgrades, except limit depth of holes to 2/3 the depth of loam layer.

D. Spread ground limestone or acidulant and fertilizer, as specified. Mix ground limestone with dry loam before spreading fertilizer and work lightly into the top 4-inches of loam by harrowing or tilling at least three days before applying commercial fertilizers.

E. Grade planting areas to smooth, even surface with loose, uniformly fine texture. Remove all stones and extraneous material in excess of 1-inch diameter. Roll, rake and remove ridges and fill depressions, as required to meet finish grades.

F. Moisten prepared areas before seeding. Water thoroughly and allow surface moisture to dry before planting. Do not create a muddy loam condition.

G. Prior to seeding or planting, restore loam to specified condition, if eroded or otherwise disturbed.

3.4 CONVENTIONAL SEEDING

A. General: Maintain grade stakes until removal is mutually agreed upon by all parties concerned.

B. Rake or harrow all seedbeds immediately prior to seeding to produce a rough, grooved surface, no deeper than 1-inch. Seed only when seedbed is in a friable condition and not muddy or hard.

C. Sow seed using a spreader or seeding machine.

D. Distribute seed evenly over entire area by sowing equal quantity in two directions at right angles to each other.

E. Sow lawn grass seed mixture at the rate of not less than required by SCDHEC Storm Water Management BMP Handbook Appendix C .

F. Sow meadow grass with minor forbs seed mixture at the rate of not less than required by SCDHEC Storm Water Management BMP Handbook Appendix C.

G. Sow wildflower meadow with minor grasses seed mixture at the rate of not less than 19-pounds per acre.

H. Cultipacker, or approved similar equipment, may be used to cover the seed and to firm the seedbed in one operation. In areas inaccessible to cultipacker:
   1. Rake the seed lightly into top 1/8-inch of loam, roll in two directions with a water ballast roller, weighing not less than 100 pounds per linear foot.
   2. Take care during raking that seed is not raked from one spot to another.
   3. Protect seeded areas against erosion by spreading specified mulch after completion of seeding operations.
      a. Protect seeded areas against hot, dry weather or drying winds by applying peat moss mulch not more than 24 hours after completion of seeding operations. Presoak and scatter evenly to a depth of from 1/8-inch to 3/16-inches thick and roll to a smooth surface. Do not mound.
      b. For slopes no steeper than one on six, spread straw mulch to form a continuous loose blanket not less than 1-1/2-inch deep over seeded areas at the approximately rate of two tons-per acre.
         1) Anchor mulch by spraying with asphalt emulsion at the rate of ten to 13-gallons per 1000 square feet.
         2) Place mulch with equipment that will blow or eject, by means of a constant air stream, controlled quantities of the mulch and asphalt in a uniform pattern over the specified area. If the mulch is excessively cut or broken, take measures to reduce the cutting or breakage. Introduce the asphalt into the air stream by means of a spray arranged so that it will partially coat the mulch with a spotty asphalt tack prior to the depositing of the mulch covering. Rate of application not less than 75-gallons per ton of mulch.
      c. Protect seeded areas, with slopes exceeding one on six, by providing erosion-control fiber mesh and where slopes exceed one on four, by providing erosion-control blankets. Install erosion-control materials according to manufacturer's written instructions and as follows:
         1) Vertically down slope without stretching fabric.
         2) Install hold down staples three per square yard minimum in center of fabric or as required to hold and shape the fabric to the contours of the slope. Install hold down staples along edges and overlaps of fabric at 9 inches on centers minimum, or as required to hold and shape the fabric to the contours of the slope.
         3) Lap fabric 4-inches minimum and turn edges of fabric into 8-inch deep by 16-inch wide earth trench and fill trench with earth.

I. Using a uniform fine spray, thoroughly and evenly water seeded areas. Provide adequate water to moisten seedbed to a depth of 2-inches.
   1. Repeat this process when peat mulch color lightens. Maintain all seedbeds in a uniformly moist condition, conducive to seed germination and plant establishment, as specified.

J. Reseed areas that remain without mulch for longer than three days.

K. Take precautions to prevent damage or staining of construction or other plantings adjacent to mulched areas. Immediately clean damaged or stained areas.

L. Prevent foot or vehicular traffic, or the movement of equipment, over the mulched areas. Reseed areas damaged as a result of such activity.

3.5 HYDROSEEDING

A. Hydroseeding: Mix specified seed, fertilizer, and fiber mulch in water, using equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into homogeneous slurry suitable for hydraulic application.

B. Mix slurry with asphalt-emulsion tackifier.

C. Apply slurry uniformly to all areas to be seeded in a two-step process. Apply first slurry application at a minimum rate of 500-pounds per acre dry weight, but not less than the rate required to obtain specified seed-sowing rate so that the seed comes into direct contact with loam.

D. Apply slurry cover coat of fiber mulch at a rate of 1000-pounds per acre.

3.6 RECONDITIONING EXISTING LAWNS AND MEADOWS

A. Recondition existing lawn and meadow damaged by CONTRACTOR'S operations, including areas used for storage of materials or equipment and areas damaged by movement of vehicles. Recondition existing lawns and meadow areas where minor regrading is required.

B. Recondition other existing lawn and meadow areas shown.

C. Provide fertilizer, seed and soil amendments, as specified for new lawn and meadow, and as required to provide satisfactorily reconditioned lawns and meadows. Provide new loam as required to fill low spots and meet new finish grades.

D. Till stripped, bare, and compacted areas thoroughly to a depth of 12-inches.

E. Remove diseased or unsatisfactory lawn and meadow areas; do not bury into soil. Remove topsoil containing extraneous materials resulting from CONTRACTOR'S operations including oil drippings, stone, gravel and other construction materials.

F. In areas approved by ENGINEER, where substantial lawns and meadows remain (but are thin), mow, dethatch, core aerate and rake. Fill low spots, remove humps, cultivate soil, fertilize, and seed. Remove weeds before seeding or if extensive, apply selective chemical weed killers, as required. Apply a seedbed mulch, if required, to maintain moist condition.

G. Water newly planted areas and keep moist until new lawns and meadows are established, as specified.

3.7 ACCEPTANCE CRITERIA FOR LAWNS AND MEADOWS

A. Lawn and meadow Work will be considered acceptable when:

1. Seeded Lawn: When a healthy, uniform, close stand of grass has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 10 square feet and bare spots not exceeding 5-inches by 5-inches.
2. Seeded Meadow: When a healthy, uniform, close stand of meadow grass and forbs has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 20 square feet and bare spots not exceeding 12-inches by 12-inches.

3.8 CLEANUP AND PROTECTION

A. Promptly remove soil and debris, created by lawn and meadow Work, from paved areas. Clean wheels of vehicles before leaving Site to avoid tracking soil and loam onto roads, walks, or other paved areas.

B. Erect barricades and warning signs as required to protect newly planted areas from traffic. Maintain barricades throughout extended service period and remove when service period ends. Treat, repair or replace damaged lawns and meadows.

C. Remove erosion-control measures after lawn and meadow extended service period ends.

D. Take all precautions to ensure that hydroseed slurry is only placed on the areas designated. Completely clean any overspray, on areas not designated to receive slurry.

3.9 INSPECTION AND ACCEPTANCE

A. Where lawns and meadows do not comply with specified acceptance criteria, reestablish lawns and meadows and continue extended service period until lawns and meadows comply with criteria for acceptance.

3.10 DEMONSTRATION

A. Engage installer’s Site supervisor to train and instruct OWNER’S personnel in the proper maintenance of lawns and meadows and procedures to be performed throughout the year for proper care and maintenance of lawn and meadows.
   1. Include instructions and training on reconditioning established lawns and meadow and sources of lawn and meadow materials.
   2. Schedule training with OWNER, through ENGINEER, with at least seven days' advance notice.

B. Review Operation and Maintenance information and be sure all instructions are clearly understood by OWNER’S personnel and are supplemented with additional information, clarifications and instructions, as required.

C. Provide minimum of two, nonconsecutive, full days on-Site training time during day shift normal working hours.

END OF SECTION

SECTION 33 05 05

BURIED PIPING INSTALLATION

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to install and test all buried piping, fittings, and specials. The Work includes the following:
      a. All types and sizes of buried piping, except where buried piping installations are specified under other Sections.
      b. Unless otherwise shown or specified, this Section includes all buried piping Work required, beginning at the outside face of structures or structure foundations, including piping beneath structures, and extending away from structures.
      c. Work on or affecting existing buried piping.
      d. Installation of all jointing and gasket materials, specials, couplings, harnessed and flanged adapters, sleeves, tie rods, cathodic protection, and other Work required for a complete, buried piping installation.
      e. Supports, restraints, and thrust blocks.
      f. Pipe encasements, with the exception of piping embedded in concrete within a structure or foundation specified under Section 40 05 05, Exposed Piping Installation.
      g. Field quality control, including testing.
      h. Cleaning and disinfecting.
      i. Incorporation of valves, meters, and special items shown or specified into piping systems in accordance with the Contract Documents and as required.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before buried piping Work.
   2. Coordinate with appropriate piping Sections of Division 40, Process Integration.

C. Related Sections:
   1. Section 03 00 05, Concrete.
   2. Section 31 23 05, Excavation and Fill.
   3. Section 40 05 19, Ductile Iron Process Pipe.
   4. Section 40 05 31, Thermoplastic Process Pipe.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASME Boiler and Pressure Vessel Code.
   2. ASME B31.3, Process Piping.
   3. American Society for Non-Destructive Testing (ASNT), ASNT-TC-1A, Recommended Practice, Personnel Qualification, and Certification in Non-destructive Testing.
   4. ASTM A377, Specification for Ductile Iron Pressure Pipe
   5. ASTM B32, Specification for Solder Metal.
   6. ASTM D2321, Practice for Underground Installation of Thermoplastic Pipe for Sewers and other Gravity-Flow Applications.
   7. ASTM D2774, Practice for Underground Installation of Thermoplastic Pressure Piping.

8. ASTM F1417, Test Method for Installation Acceptance of Plastic Gravity Sewer Lines using Low-Pressure Air.
9. ASTM F2164, Standard Practice for Field Leak Testing of Polyethylene (PE) Pressure Piping Systems Using Hydrostatic Pressure.
10. ANSI/AWWA C105, Polyethylene Encasement for Ductile-Iron Pipe Systems.
11. ANSI/AWWA C111, Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
12. ANSI/AWWA C600, Installation of Ductile-Iron Water Mains and Their Appurtenances.
13. ANSI/AWWA C605, Underground Installation of Polyvinyl Chloride (PVC) Pressure Pipe and Fittings for Water.
14. ANSI/AWWA C651, Disinfecting Water Mains.
15. AWWA M23, PVC Pipe – Design and Installation.
16. AWWA M41, Ductile-Iron Pipe and Fittings.
17. ASCE 37, Design and Construction of Sanitary and Storm Sewers.
18. NFPA 24, Standard for the Installation of Private Fire Service Mains and Their Appurtenances.

1.3 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Comply with requirements and recommendations of authorities having jurisdiction over the Work, including:
      a. York County.
      b. South Carolina Department of Transportation.
      c. South Carolina Department of Health and Environmental Control.
   2. Obtain required permits for Work in roads, rights-of-way, railroads, and other areas of the Work.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Laying schedules for piping with restrained joints.
      b. Details of piping, specials, joints, harnessing and thrust blocks, and connections to piping, structures, equipment, and appurtenances.
   2. Product Data:
      a. Manufacturer's literature and specifications, as applicable, for products specified in this Section.
   3. Testing Procedures:
      a. Submit proposed testing procedures, methods, apparatus, and sequencing. Obtain ENGINEER's approval prior to commencing testing.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Certificate signed by manufacturer of each product certifying that product conforms to applicable referenced standards.
   2. Field Quality Control Submittals:
      a. Results of each specified field quality control test.

C. Closeout Submittals: Submit the following:
   1. Record Documentation:

a. Maintain accurate and up-to-date record documents showing modifications made in the field, in accordance with approved submittals, and other Contract modifications relative to buried piping Work. Submittal shall show actual location of all piping Work and appurtenances at same scale as the Drawings.
b. Show piping with elevations referenced to Project datum and dimensions from permanent structures. For each horizontal bend in piping, include dimensions to at least three permanent structures, when possible. For straight runs of piping provide offset dimensions as required to document piping location.
c. Include profile drawings with buried piping record documents when the Contract Documents include piping profile drawings.
d. Conform to Section 01 78 39, Project Record Documents.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Delivery:
1. Deliver materials to the Site to ensure uninterrupted progress of the Work.
2. Upon delivery inspect pipe and appurtenances for cracking, gouging, chipping, denting, and other damage and immediately remove from Site and replace with acceptable material.

B. Storage:
1. Store materials to allow convenient access for inspection and identification. Store material off ground using pallets, platforms, or other supports. Protect packaged materials from corrosion and deterioration.
2. Pipe and fittings other than PVC and CPVC may be stored outdoors without cover. Cover PVC and CPVC pipe and fittings stored outdoors.

C. Handling:
1. Handle pipe, fittings, specials, and accessories carefully in accordance with pipe manufacturer's recommendations. Do not drop or roll material off trucks. Do not drop, roll or skid piping.
2. Avoid unnecessary handling of pipe.
3. Keep pipe interiors free from dirt and foreign matter.
4. Protect interior linings and exterior coatings of pipe and fittings from damage. Replace pipe and fittings with damaged lining regardless of cause of damage.

PART 2 PRODUCTS

2.1 MATERIALS

A. Piping materials are specified in the Buried Piping Schedule at end of this Section. Piping materials shall conform to Specifications for each type of pipe and piping appurtenances in applicable Sections of Division 40, Process Integration.

B. General:
1. Pipe Markings:
a. Factory-mark each length of pipe and each fitting with designation conforming to those on approved laying schedules.

b. Manufacturer shall cast or paint on each length of pipe and each fitting pipe material, diameter, and pressure or thickness class.

C. Polyethylene Encasement:
1. Polyethylene may be supplied in tubes or sheets.
2. Polyethylene encasement materials shall be in accordance with ANSI/AWWA C105.

D. Cathodic Protection:
1. Bonding Cables: Bonding cable and test lead wires shall be not less than No. 6 AWG, Type CP copper cathodic protection cable, with low density, high molecular weight polyethylene insulation.
2. Test Lead Stations: Provide test lead stations where shown and indicated in the Contract Documents. Standard connection boxes for test lead stations shall be plastic terminal boxes, 18 inches long and five-inch inside diameter, with locking cast iron lid with "CP TEST" cast into cover. Inside terminal box shall be terminal block with seven terminals. Terminal box shall be manufactured by C.P. Test Services "NM-7" or equal.

2.2 BURIED PIPING IDENTIFICATION

A. Polyethylene Underground Warning Tape for Metallic Pipelines:
1. Tracer tape shall be of inert, acid- and alkali-resistant, polyethylene, four mils thick, six inches wide, suitable for direct burial. Tape shall be capable of stretching to twice its original length.
2. Message shall read, "CAUTION [insert customized name of pipe service, i.e., "POTABLE WATER", "SANITARY SEWER", "REUSE WATER", or other service as appropriate, as indicated in the Buried Pipe Schedule at the end of this Section] PIPE BURIED BELOW", with bold letters approximately two inches high. Messages shall be printed at maximum intervals of two feet. Tape shall be custom colored as follows:
a. Blue, for water pipelines.
b. Green, for sewer pipelines.
3. Manufacturer: Provide products of one of the following:
a. Brady Corporation.
b. Seton Identification Products.
c. Marking Services, Inc.
d. Or equal.

B. Detectable Underground Warning Tape for Non-Metallic Pipelines:
1. Tape shall be of inert, acid- and alkali-resistant, polyethylene, five mils thick, six inches wide, with aluminum backing, and have 15,000 psi tensile strength and 80 percent elongation capability. Tape shall be suitable for direct burial.
2. Message shall read, "CAUTION [insert customized name of pipe service, i.e., "POTABLE WATER", "SANITARY SEWER", "CHLORINE GAS", or other appropriate service, as indicated in the Buried Pipe Schedule at the end of this Section] PIPE BURIED BELOW" with bold letters approximately two inches high. Messages shall be printed at maximum intervals of two feet. Tape shall be custom colored as follows:
a. Blue, for water pipelines.
b. Green, for sewer pipelines.
c. Purple, for reuse pipelines.
3. Manufacturer: Provide products of one of the following:
a. Brady Corporation.
b. Seton Identification Products.

c. Marking Services, Inc.
d. Or equal.

PART 3 EXECUTION

3.1 INSTALLATION

A. General:
1. Install piping as shown, specified, and as recommended by pipe and fittings manufacturer.
2. In event of conflict between manufacturer's recommendations and the Contract Documents, request interpretation from ENGINEER before proceeding.
3. ENGINEER will observe excavations and bedding prior to laying pipe by CONTRACTOR. Notify ENGINEER in advance of excavating, bedding, pipe laying, and backfilling operations.
4. Minimum Cover Over Buried Water Piping and Sewer Force Mains:
   a. Provide minimum cover of 30-inches, unless pipe material is ductile iron or other approved material and insulated to prevent freezing, or otherwise shown or approved by ENGINEER.
   b. For all crossings of water courses:
      1) Provide minimum cover under channel bed of 36-inches.
      2) Provide ductile iron pipe with restrained joints.
   c. For crossing of water courses greater than 15-feet in width:
      1) Provide easily-accessible valves which allow for isolating the section for testing and repair.
      2) Provide a blow-off on the side opposite the supply side. Direct blow-off away from any streams.
5. Minimum Cover Over Buried Sewer Piping:
   a. Provide minimum cover of 36-inches and maximum cover of 16-feet over PVC pipe. Provide ductile iron pipe if less than 36-inches or greater than 16-feet of cover.
6. Earthwork is specified in Section 31 23 05.
7. Excavation in excess of that required or shown, and that is not authorized by ENGINEER shall be filled at CONTRACTOR's expense with granular material furnished, placed, and compacted in accordance with Section 31 23 05, Excavation and Fill.
8. Comply with NFPA 24 for "Outside Protection", where applicable to water piping systems used for fire protection.

B. Manufacturer's Installation Specialist:
1. Provide services of competent installation specialist of pipe manufacturer when pipe installation commences for:
   a. Thermoplastic pipe.
2. Retain installation specialist at the Site for minimum of 1 day (eight hours per day at the Site) or until competency of pipe installation crew has been satisfactorily demonstrated.

C. Separation of Sewers and Potable Water Piping:
1. Horizontal Separation:
   a. Where possible, existing and proposed potable water mains and service lines, and sanitary and storm sewers shall be separated horizontally by clear distance of at least ten feet.

b. If local conditions preclude the specified clear horizontal separation, installation will be allowed if potable water main is in separate trench and with bottom of potable water main at least 18 inches above top of sewer.
c. Exception:
1) Where it is not possible to provide minimum horizontal separation between water main and sanitary sewer main as described above, construct potable water main and sewer of ceramic epoxy-lined ductile iron pipe with restrained push-on joint or restrained mechanical joint pipe complying with public water supply design standards of authority having jurisdiction. Hydrostatically test water main and sewer as specified in this Section prior to backfilling. Hydrostatic test pressure at crossing shall be at least 150 psi.
2) Where it is not possible to provide minimum horizontal distance between water main and storm sewer or catch basin, provide ductile iron with joints as far as possible from the storm sewer or catch basin
d. Install sewer lines, manholes, pump stations and force mains at least 100-feet from public water supply wells and at least 20-feet from any other potable water well.
e. Install water mains no less than 25-feet from any portion of a waste-water tile-filed or spray-field.

2. Vertical Separation:
a. a. Sewer Main Crossing over Water Main:
1) Provide minimum vertical distance of 18-inches between outside of potable water main and outside of sewer when sewer crosses over potable water main.
2) Provide cement-lined ductile iron sewer and water mains for a distance of 10-feet on each side of the point of crossing, with valves as far as possible from the crossing. Provide valves on sewer and water mains that comply with drinking water standards.
3) Hydrostatically test water main and sewer as specified in this Section, prior to backfilling. Hydrostatic test pressure at crossing shall be at least 150 psi.
b. Sewer Main Crossing under Water Main:
1) Provide minimum vertical distance of 18-inches between outside of potable water main and outside of sewer when sewer crosses under potable water main.
2) If less than 18-inches of vertical separation is possible, provide water main ceramic epoxy-lined ductile iron sewer main for a distance of 10-feet on each side of the point of crossing, with joints as far as possible from the crossing.
c. Provide adequate structural support where potable water main crosses sewer. At minimum, provide compacted select backfill for ten feet on each side of crossing.
d. PVC Water Main Crossing Other Buried Pipeline Utilities:
1) Provide minimum vertical distance of 12-inches and Type 5 bedding for water main. If this requires water main deeper than 5-feet, DIP (or brass or stainless for 2” mains) may be installed with less than 12-inches clearance provided 3-feet cover is provided for water main.

D. Plugs:
1. Temporarily plug installed pipe at end of each day of work, during lunch, or other interruption of pipe installation to prevent entry of animals, liquids, and persons into pipe, and entrance or insertion of deleterious materials into pipe.
2. Install standard plugs in bells at dead ends, tees, and crosses. Cap spigot and plain ends.
3. Fully secure and block plugs, caps, and bulkheads installed for testing to withstand specified test pressure.
4. Where plugging is required for phasing of the Work or subsequent connection of piping, install watertight, permanent type plugs, caps, or bulkhead acceptable to ENGINEER.

E. Bedding Pipe: Bed pipe as specified and in accordance with details on the Drawings.
   1. Trench excavation and backfill, and bedding materials shall conform to Section 31 23 05, as applicable.
   2. Where ENGINEER deems existing bedding material unsuitable, remove and replace existing bedding with approved granular material furnished, placed, and compacted in accordance with Section 31 23 05, Excavation and Fill. Payment for additional excavation and providing granular material will be made under the unit price payment items in the Contract.
   3. Where pipe is installed in rock excavation, Type 5 bedding or bedding as directed by ENGINEER shall be installed.
   4. Excavate trenches below bottom of pipe by amount shown and indicated in the Contract Documents. Remove loose and unsuitable material from bottom of trench.
   5. Carefully and thoroughly compact pipe bedding with hand held pneumatic compactors.
   6. Do not lay pipe until ENGINEER approves bedding condition.
   7. Do not bring pipe into position until preceding length of pipe has been bedded and secured in its final position.

F. Laying Pipe:
   1. Conform to manufacturer's instructions and requirements of standards and manuals listed below, as applicable:
      a. Ductile Iron Pipe: ANSI/AWWA C600, ANSI/AWWA C105, AWWA M41, ASTM A377
      b. Thermoplastic Pipe: ASTM D2321, ASTM D2774, ANSI/AWWA C605, AWWA M23, AWWA M45, AWWA, M55.
      c. Sanitary and Storm Sewers: ASCE 37.
   2. Install pipe accurately to line and grade shown and indicated in the Contract Documents, unless otherwise approved by ENGINEER. Remove and reinstall pipes that are not installed correctly.
   3. Slope piping uniformly between elevations shown.
   4. Keep groundwater level in trench at least 12-inches below bottom of trench before laying pipe. Do not lay pipe in water. Maintain dry trench conditions until jointing and backfilling are complete. Keep clean and protect interiors of pipe, fittings, valves, and appurtenances.
   5. Start laying pipe at lowest point and proceed towards higher elevations, unless otherwise approved by ENGINEER.
   6. Place bell and spigot-type pipe so that bells face the direction of laying, unless otherwise approved by ENGINEER.
   7. Excavate around joints in bedding and lay pipe so that pipe barrel bears uniformly on trench bottom.
   8. Deflections at joints shall not exceed 75 percent of amount allowed by pipe manufacturer, unless otherwise approved by ENGINEER.
   9. For copper tubing, snake piping in trench to compensate for thermal expansion and contraction.
   10. Carefully examine pipe, fittings, valves, and specials for cracks, damage, and other defects while suspended above trench before installation. Immediately remove defective materials from the Site and replace with acceptable products.
   11. Inspect interior of all pipe, fittings, valves, and specials and completely remove all dirt, gravel, sand, debris, and other foreign material from pipe interior and joint recesses before pipe and appurtenances are moved into excavation. Bell and spigot-type mating surfaces shall be thoroughly wire brushed and wiped clean and dry immediately before pipe is laid.
   12. Field cut pipe, where required, with machine specially designed for cutting the type of pipe being installed. Make cuts carefully, without damage to pipe, coating or lining, and with smooth end at right angles to axis of pipe. Cut ends on push-on joint type pipe shall be

tapered and sharp edges filed off smooth. Do not flame-cut pipe. When making connections to existing mains which require water mains to be removed from service, automatic traveling pipe cutting machines will be required on 16-inch and larger.

13. Do not place blocking under pipe, unless specifically approved by ENGINEER for special conditions.
14. Touch up protective coatings in manner satisfactory to ENGINEER prior to backfilling.
15. Notify ENGINEER in advance of backfilling operations.
16. On steep slopes, take measures acceptable to ENGINEER to prevent movement of pipe during installation.
17. Thrust Restraint: Where required, provide thrust restraint conforming to Article 3.3 of this Section.
18. Exercise care to avoid flotation when installing pipe in cast-in-place concrete, and in locations with high groundwater.

G. Polyethylene Encasement:
   1. Provide polyethylene encasement for ductile iron piping to prevent contact between pipe and surrounding bedding material and backfill.
   2. Polyethylene encasement installation shall be in accordance with ANSI/AWWA C105.

H. Jointing Pipe:
   1. Ductile Iron Mechanical Joint Pipe:
      a. Immediately before making joint, wipe clean the socket, plain end, and adjacent areas. Taper cut ends and file off sharp edges to provide smooth surface.
      b. Lubricate plain ends and gasket with soapy water or manufacturer's recommended pipe lubricant, in accordance with ANSI/AWWA C111, just prior to slipping gasket onto plain end of the joint assembly.
      c. Place gland on plain end with lip extension toward the plain end, followed by gasket with narrow edge of gasket toward plain end.
      d. Insert plain end of pipe into socket and press gasket firmly and evenly into gasket recess. Keep joint straight during assembly.
      e. Push gland toward socket and center gland around pipe with gland lip against gasket.
      f. Insert bolts and hand-tighten nuts.
      g. If deflection is required, make deflection after joint assembly and prior to tightening bolts. Alternately tighten bolts approximately 180 degrees apart to seat gasket evenly. Bolt torque shall be as follows:

Pipe Diameter (inches)	Bolt Diameter (inches)	Range of Torque (ft-lbs)
3	5/8	40 to 60
4 to 24	3/4	60 to 90
30 to 36	1	70 to 100
42 to 48	1.25	90 to 120

      h. Bolts and nuts, except those of stainless steel, shall be coated with two coats, minimum dry film thickness of eight mils each, of high build solids epoxy or bituminous coating manufactured by Tnemec, or equal.
      i. Restrained mechanical joints shall be in accordance with Section 40 05 19, Ductile Iron Process Pipe.
   2. Ductile Iron Push-On Joint Pipe:

a. Prior to assembling joints, thoroughly clean with wire brush the last eight inches of exterior surface of spigot and interior surface of bell, except where joints are lined or coated with a protective lining or coating.
b. Wipe clean rubber gaskets and flex gaskets until resilient. Conform to manufacturer's instructions for procedures to ensure gasket resiliency when assembling joints in cold weather.
c. Insert gasket into joint recess and smooth out entire circumference of gasket to remove bulges and to prevent interference with proper entry of spigot of entering pipe.
d. Immediately prior to joint assembly, apply thin film of pipe manufacturer's recommended lubricant to surface of gasket that will come in contact with entering spigot end of pipe, or apply a thin film of lubricant to outside of spigot of entering pipe.
e. For assembly, center spigot in pipe bell and push pipe forward until spigot just makes contact with rubber gasket. After gasket is compressed and before pipe is pushed or pulled in the rest of the way, carefully check gasket for proper position around the full circumference of joint. Final assembly shall be made by forcing spigot end of entering pipe past gasket until spigot makes contact with base of the bell. When more than a reasonable amount of force is required to assemble the joint, remove spigot end of pipe to verify proper positioning of gasket. Do not use gaskets that have been scored or otherwise damaged.
f. Maintain an adequate supply of gaskets and joint lubricant at the Site when pipe jointing operations are in progress.

3. Ductile Iron Proprietary Joints:
   a. Install pipe that utilizes proprietary joints for restraint specified in Section 40 05 19, Ductile Iron Process Pipe, or other such joints, in accordance with manufacturer's instructions.
4. Thermoplastic Pipe Joints:
   a. Bell and Spigot Joints:
      1) Bevel pipe ends, remove all burrs, and provide a reference mark at correct distance from pipe end before making joints.
      2) Clean spigot end and bell thoroughly before making the joint. Insert O-ring gasket while ensuring that gasket is properly oriented. Lubricate spigot with manufacturer's recommended lubricant. Do not lubricate bell and O-ring. Insert spigot end of pipe carefully into bell until reference mark on spigot is flush with bell.
5. Copper Tubing Joints:
   a. Soldered Joints:
      1) Assemble copper tubing with soldered joints. Solder shall be 95-5 tin-antimony solder conforming to ASTM B32.
      2) Ream or file pipe to remove burrs.
      3) Clean and polish contact surfaces of joints.
      4) Apply flux to both male and female ends.
      5) Insert end of tube into full depth of fitting socket.
      6) Heat joint evenly.
      7) Form continuous solder bead around entire circumference of joint starting at the bottom.
   b. Threaded Joints:
      1) When open flames for soldering are impractical, or at unions and connections to equipment and appurtenances, assemble copper tubing with flared ends as permitted by authority having jurisdiction.

2) Ends of tubing shall be flared at an angle of 45 degrees with flaring tool recommended by pipe manufacturer. Flaring tool shall have same outside diameter as tube to be flared.
3) Tubing to be flared shall be soft temper or annealed prior to flaring.
4) End of tube shall be cut square and reamed to remove burrs.
5) Tube that is out-of-round shall be resized back to round.
6) Clean and polish contact surfaces of joints using an abrasive cloth.
7) Place flare nut over the end of tube with threads closest to end being flared.
8) Insert appropriate length of tube between flaring bar of flaring tool and position the yolk with flaring cone over tube end and clamp yoke in place.
9) Turn handle of yolk clockwise without over-tightening. Cracked or deformed tubes will be rejected.
10) Do not apply jointing compounds to mating surfaces of flare fitting and flared tube end before attaching flare nut to threaded connection.

6. Mechanical Coupling Joints:
   a. Do not use sleeve couplings in water mains except for: connections to existing mains, connections between different pipe materials, or as necessary for repairs during pressure/leakage tests.
   b. Provide couplings for sewer lines 12-inches and smaller per Section 33 05 06, Couplings, Adapters and Specials.
   c. Prior to installing and assembling mechanical couplings, thoroughly clean joint ends with wire brush to remove foreign matter.
   d. Loosen the stainless steel clamping bands and remove clamps from coupling. Slide coupling over plain ends of pipes to be joined without using lubricants. Place clamps over each end of coupling at grooved section and tighten with torque wrench to torque recommended by manufacturer.

I. Backfilling:
1. Conform to applicable requirements of Section 31 23 05, Excavation and Fill.
2. Place backfill as Work progresses. Backfill by hand and use power tampers until pipe is covered by at least one foot of backfill.

J. Connections to Valves and Hydrants:
1. Install valves and hydrants as shown and indicated in the Contract Documents.
2. Provide suitable adapters when valves or hydrants and piping have different joint types.
3. Provide thrust restraint at all hydrants and at valves located at pipeline terminations.

K. Transitions from One Type of Pipe to Another:
1. Provide necessary adapters, specials, and connection pieces required when connecting different types and sizes of pipe or connecting pipe made by different manufacturers.

L. Closures:
1. Provide closure pieces shown or required to complete the Work.

3.2 TRACER WIRE INSTALLATION

A. Detectable Underground Tracer Wire for Non-Metallic Pipelines:
1. Provide and install a 14-gauge solid copper wire on top of all new non-metallic pipeline.
2. Secure the wire to the pipe with duct tape near every bell and at the center of each pipe joint.
3. Fasten the wire securely to a cast iron fitting at each main line valve and to service lines.

B. Detectable Underground Tracer Wire for Hydrant Leads:
   1. Provide and install a 14-gauge solid copper wire around all new hydrant leads.
   2. Install wire around all horizontal portions of the hydrant lead, as well as the buried hydrant gate valve.
   3. Wrap the wire at frequency of no less than one revolution per linear foot of pipe.
   4. Fasten the wire securely to the 90-degree fittings at each end of the horizontal portion of hydrant lead.

3.3 THRUST RESTRAINT

A. Provide thrust restraint on pressure piping systems where shown or indicated in the Contract Documents.

B. Thrust restraint shall be accomplished by using restrained pipe joints. Concrete thrust blocks and/or harnessing buried pipe may be used if approved by the ENGINEER. Thrust restraints shall be designed for axial thrust exerted by test pressure specified in the Buried Piping Schedule at the end of this Section.

C. If so approved, place concrete thrust blocks against undisturbed soil. Thrust blocks shall not be installed where undisturbed soil does not exist and/or where the Site consists of backfill material.

D. Restrained Pipe Joints:
   1. Pipe joints shall be restrained by means suitable for the type of pipe being installed.
      a. Ductile Iron, Push-on Joints and Mechanical Joints: Restrain with proprietary restrained joint system as specified in Section 40 05 19, Ductile Iron Process Pipe; lugs and tie rods; or other joint restraint systems approved by ENGINEER.
      b. Thermoplastic Joints: Where bell and spigot-type or other non-restrained joints are utilized, provide tie rods across joint or other suitable joint restraint system, subject to the approval of ENGINEER.

E. Concrete Thrust Blocks:
   1. Provide concrete thrust blocks on pressure piping at changes in alignment of 15 degrees or more, at tees, plugs and caps, and where shown or indicated in the Contract Documents. Construct thrust blocks conforming to 03 00 05, Concrete.
   2. Install thrust blocks against undisturbed soil. Place concrete so that pipe and fitting joints are accessible for repair.
   3. Concrete thrust block size shall be as shown on the Drawings or as approved by ENGINEER.

F. Harnessed lengths of buried pipe shall be as shown on the Drawings.

3.4 WORK AFFECTING EXISTING PIPING

A. Location of Existing Underground Facilities:
   1. Locations of existing Underground Facilities shown on the Drawings should be considered approximate.
   2. Determine the true location of existing Underground Facilities to which connections are to be made, crossed, and that could be disturbed, and determine location of Underground Facilities that could be disturbed during excavation and backfilling operations, or that may be affected by the Work.

B. Taking Existing Pipelines and Underground Facilities Out of Service:
   1. Conform to Section 01 14 16, Coordination with Owner's Operations.
   2. Do not take pipelines or Underground Facilities out of service unless specifically listed in Section 01 14 16, Coordination with Owner's Operations, or approved by ENGINEER.
   3. Notify ENGINEER in writing prior to taking pipeline or Underground Facilities out of service. Shutdown notification shall be provided in advance of the shutdown in accordance with the General Conditions and Section 01 14 16, Coordination with Owner's Operations.

C. Work on Existing Pipelines or Underground Facilities:
   1. Cut or tap piping or Underground Facilities as shown or required with machines specifically designed for cutting or tapping pipelines or Underground Facilities, as applicable.
   2. Install temporary plugs to prevent entry of mud, dirt, water, and debris into pipe.
   3. Provide necessary adapters, sleeves, fittings, pipe, and appurtenances required to complete the Work.
   4. Conform to applicable requirements of Section 01 14 16, Coordination with Owner's Operations and Section 01 73 29, Cutting and Patching.

3.5 FIELD QUALITY CONTROL

A. General:
   1. Test all piping, except as exempted in the Buried Piping Schedule in this Section.
   2. When authorities having jurisdiction are to witness tests, notify ENGINEER and authorities having jurisdiction in writing at least 48 hours in advance of testing.
   3. Conduct all tests in presence of ENGINEER.
   4. Remove or protect pipeline-mounted devices that could be damaged by testing.
   5. Provide all apparatus and services required for testing, including:
      a. Test pumps, compressors, hoses, calibrated gages, meters, test containers, valves, fittings, and temporary pumping systems required to maintain OWNER's operations.
      b. Temporary bulkheads, bracing, blocking, and thrust restraints.
   6. Provide air if an air test is required, power if pumping is required, and gases if gases are required.
   7. Unless otherwise specified, OWNER will provide fluid required for hydrostatic testing. CONTRACTOR shall provide means to convey fluid for hydrostatic testing into piping being tested. CONTRACTOR shall provide fluid for other types of testing required.
   8. Repair observed leaks and repair pipe that fails to meet acceptance criteria. Retest after repair.
   9. Unless otherwise specified, testing shall include existing piping systems that connect with new piping system. Test existing pipe to nearest valve. Piping not installed by CONTRACTOR and that fails the test shall be repaired upon authorization of OWNER. Unless otherwise included in the Work, repair of existing piping or Underground Facilities will be paid as extra Work.

B. Test Schedule:
   1. Refer to the Buried Piping Schedule in this Section for type of test required and required test pressure.
   2. Unless otherwise specified, required test pressures are at lowest elevation of pipeline segment being tested.
   3. For piping not listed in Buried Piping Schedule in this Section:
      a. Hydrostatically test pipe that will convey liquid at a pressure greater than five psig. Provide process air pipe test for pipe that will convey air or gas under pressure or vacuum, except chlorine gas, which requires separate test.

b. Use exfiltration testing, low-pressure air testing, or vacuum testing for other piping.
c. Disinfect for bacteriological testing piping that conveys potable water.

4. Test Pressure:
   a. Use test pressures listed in Buried Piping Schedule in this Section.
   b. If test pressure is not listed in Buried Piping Schedule, or if test is required for piping not listed in the Buried Piping Schedule, test pressure will be determined by ENGINEER based on maximum anticipated sustained operating pressure and methods described in applicable ANSI/AWWA manual or standard that applies to the piping system.

C. Hydrostatic Testing:
1. Preparation for Testing:
   a. For thermoplastic pipe, follow procedures described in Section 7 of ANSI/AWWA Standard C605.
   b. For ductile iron pipe, follow procedures described in ANSI/AWWA Standard C600.
   c. Prior to testing, ensure that adequate thrust protection is in place and joints are properly installed.
   d. The maximum length pipe tested in one test shall be 5,000-feet.
2. Test Procedure:
   a. Fill pipeline slowly to minimize air entrapment and surge pressures. Fill rate shall not exceed one foot of pipe length per second in pipe being tested.
   b. Expel air from pipe as required. Obtain approval of ENGINEER prior to tapping pipe for expelling air.
   c. Examine exposed joints and valves, and make repairs to eliminate visible leakage.
   d. After specified wetting period, add fluid as required to pressurize line to required test pressure. Maintain test pressure for a stabilization period of ten minutes before beginning test.
   e. Timed test period shall not begin until after pipe has been filled, exposed to required wetting period, air has been expelled, and pressure stabilized.
   f. Timed Test Period: After stabilization period, maintain test pressure for at least two hours. During timed testing period, add fluid as required to maintain pressure within five psig of required test pressure.
   g. Pump from test container to maintain test pressure. Measure volume of fluid pumped from test container and record on test report. Record pressure at test pump at 15 minute intervals for duration of test.
3. Allowable Leakage Rates: Leakage is defined as the quantity of fluid supplied to pipe segment being tested to maintain pressure within five psi of test pressure during timed test period. Allowable leakage rates for piping are:
   a. No Leakage: Pipe with fused, threaded, soldered, or brazed joints.
   b. Rates based on formula or table in ANSI/AWWA Manual M41:
      1) Metal pipe joined with rubber gaskets as sealing members, including the following joint types:
         a) Bell and spigot and push-on joints.
         b) Mechanical joints.
         c) Bolted sleeve type couplings.
         d) Grooved and shouldered couplings.
   c. Rates based on formula or table in ANSI/AWWA C605:
      1) Plastic pipe joined with O-ring gasket sealing members.

D. Exfiltration Testing for Manholes:
1. Test 25-percent of all manholes, as selected by ENGINEER.

2. Plug and bulkhead inlet and outlet pipes and lateral connections to manhole to be tested and admit fluid until the manhole is full.
3. Allow water level to saturate, then refill and mark the level of water.
4. Test duration shall be at least two hours.
5. Allowable leakage rate shall be 3-gallons per hour.

E. Gravity Sewer Pipe Leakage Testing
   1. After minimum 10-days following completion of backfill, determine level of the ground water table and submit to County Inspector. If level of ground water table is above the top of the pipe, test the sewer line for infiltration. Otherwise, use low pressure air test.
   2. Infiltration Test:
      a. Test up to 1-mile section of constant diameter pipe at a time.
      b. Isolate test section by installing suitable upstream watertight bulkheads.
      c. Take 6 readings at 5-minute intervals and use the average to determine rate of infiltration for the test section.
      d. Infiltration shall not exceed 100 gallons per day per inch-diameter per mile.
      e. Isolate and test any individual section between two manholes separately if so directed by ENGINEER.
      f. Facilitate York County Water/Sewer Department to use video equipment in any section to detect infiltration sources.
   3. Low Pressure Air Test:
      a. Plug and bulkhead ends and lateral connections of pipe segment to be tested.
      b. Required test pressure shall be increased by an amount equal to the elevation of groundwater above invert of lowest point of pipe segment being tested.
      c. Test in accordance with requirements of authority having jurisdiction.
      d. For thermoplastic pipe, use test procedures described in ASTM 1417.

F. Vacuum Testing:
   1. Plug and bulkhead ends and lateral connections of pipe segment or manhole to be tested.
   2. Following set-up of test apparatus, draw vacuum of ten inches of mercury on pipe segment or manhole being tested.
   3. Start test upon reaching specified test vacuum. Test duration shall be 15 minutes.
   4. Record vacuum drop at end of test. If vacuum drop is greater than one inch of mercury, pipe segment or manhole fails the test and shall be repaired and retested. If vacuum drop is less than one inch of mercury, pipe segment or manhole passes the test.

G. Vertical Deflection Test for Thermoplastic Pipe:
   1. Conduct vertical deflection test at least thirty days after backfill has been placed.
   2. Perform test using one of the following two methods
      a. Manually pull pin-type vertical gauge mounted on sled through pipe. Gauge shall be manufactured by Quality Test Products, or equal. Set gauge so that sled will stop if vertical deflection of pipe exceeds five percent. Excavate and re-install piping that fails deflection test, and retest.
      b. Use rigid ball or mandrel for deflection test, which shall have diameter of at least 95 percent of base inside diameter or average inside diameter of piping, depending on which is specified in applicable ASTM standard, including appendix, to which pipe is manufactured. Perform test without mechanical pulling devices. Re-install and retest pipe segments that exceed deflection of five percent.

H. Bacteriological Testing:

1. Bacteriological testing for potable water lines, finished water lines, and other piping in accordance with the Buried Piping Schedule, is specified in Part 3 of this Section.

3.6 CLEANING AND DISINFECTION

A. Cleaning, General: Clean pipe systems as follows:
   1. Thoroughly clean all piping, including flushing with water, dry air, or inert gas as required, in manner approved by ENGINEER, prior to placing in service. Flush chlorine solution and sodium hypochlorite piping with water.
   2. Piping 24-inch diameter and larger shall be inspected from inside and debris, dirt and foreign matter removed.
   3. For piping that requires disinfection and has not been kept clean during storage or installation, swab each section individually before installation with five percent sodium hypochlorite solution.

B. Disinfection:
   1. Disinfect all potable and finished water piping.
   2. Suggested procedure for accomplishing complete and satisfactory disinfection is specified below. Other procedures may be considered for acceptance by ENGINEER.
      a. Prior to disinfection, clean piping as specified and flush thoroughly.
      b. Conform to procedures described in ANSI/AWWA C651. Use continuous feed method of disinfecting, unless alternative method is acceptable to ENGINEER.
   3. Water for initial flushing, testing, and disinfection will be furnished by OWNER. CONTRACTOR shall provide all temporary piping, hose, valves, appurtenances, and services required. Cost of water required for redisinfection will be paid by CONTRACTOR to OWNER at water utility's standard rates.
   4. Chlorine shall be provided by CONTRACTOR.
   5. Bacteriologic tests shall be performed by CONTRACTOR. Provide certified test laboratory report to OWNER.
   6. Chlorine concentration in water entering the piping shall be between 50 and 100 ppm, such that minimum residual concentration of 25 mg/L remains after 24-hour retention period. Disinfect piping and all related components. Repeat as necessary to provide complete disinfection.
   7. After required retention period, flush chlorinated water to closed drain line, unless otherwise acceptable to ENGINEER. Properly dispose of chlorinated water in accordance with Laws and Regulations. Do not discharge chlorinated water to storm sewers, ditches, or overland.

3.7 CATHODIC PROTECTION

A. General:
   1. Provide cathodic protection for buried steel pipelines.
   2. Provide insulated joint at each of the following:
      a. Connection to steel water tanks and each branch connecting to a water line.
      b. Connection between concrete pipe and steel pipe, and between ductile iron pipe and steel pipe.
      c. Connection through wall.
      d. Where indicated.
   3. Provide electrical bond across all other gasketed steel pipe joints.
   4. Provide test lead stations for monitoring electrical currents on pipeline at locations shown and indicated in the Contract Documents.

B. Details of Cathodic Protection:
   1. Insulated Joints: Where shown or indicated in the Contract Documents, provide insulated flange type joints. After joint is made, provide exterior coating around joint as specified for piping being joined.
   2. Electrical Bond Across Rubber Gasket Joints: Provide two electrical bonding cables across each rubber-gasketed bell and spigot joint. Before exterior coating is applied to bell and spigot joints, two small areas of metal shall be exposed on each side of joint, one on spigot ring and one on bell. Thoroughly clean each area and bond two cathodic protection cables to pipe, one on each side of joint. Bond each cable by thermite process. Coat completed connections and exposed metal as specified for exterior coating of pipe being joined.
   3. Electrical Bond Across Mechanical Couplings: Provide two electrical bonding cables across each mechanical coupling. Before the exterior coating is applied to mechanical couplings, expose two small areas of metal on pipe surface on each side of coupling, on middle ring and on each follower ring of coupling. Thoroughly clean each area and bond two cathodic protection cables to pipe, one on each side of joint and to middle ring and follower rings of mechanical coupling. Bond each cable by thermite process. Coat completed connections and exposed metal as specified for exterior coating of pipe being joined.
   4. Electrical Bond Across Valves and Flanges: Provide two electrical bonding cables across valves and flanged connections other than insulated flange type joints. Provide electrical bond as specified for bond across rubber gasket joints.
   5. Test Lead Stations: Provide test lead stations where shown and indicated in the Contract Documents. Terminate test lead on ground surface in standard connection box at a protected location acceptable to ENGINEER.

3.8 SCHEDULES

A. Schedules listed below, following the “End of Section” designation, are part of this Specification section.
   1. Table 33 05 05-A, Buried Piping Schedule.

END OF SECTION

TABLE 33 05 05-A, BURIED PIPING SCHEDULE

Service	Diameter (inch)	Material	Interior Lining	Exterior Coating	Pressure Class/ Thickness	Joint	Test	Remarks

The following abbreviations are used in the Buried Piping Schedule.

A. Service Abbreviations

Service	Abbrev		Service	Abbrev.
Sanitary Sewer	SAN		Wastewater	WW
Storm Sewer	ST		Chlorine Solution	CLS
Sanitary Force Main	SFM		Sodium Hypochlorite	NAOCL
Raw Water	RW		Plant Effluent Water	PEW
Potable Water	PW		Drain	DR
County Water	CW		Chlorine Gas	CLG

B. Material Abbreviations

Material	Abbrev		Material	Abbrev.
Ductile Iron	DI		Polyvinyl Chloride	PVC
Cast Iron	CI		Copper	C
Chlorinated Polyvinyl Chloride	CPVC			

C. Lining/Coating Abbreviations

Lining	Abbrev		Coating	Abbrev.
Cement Mortar Lined	CL		Asphaltic Coated	AC
Painted	P		Polyethylene Wrapped	PEW
Ceramic Epoxy	CE			

D. Joint Abbreviations

Joint Type	Abbrev		Joint Type	Abbrev.
Bell and Spigot	BS		Restrained Mech. Joint	RMJ
Restrained Bell and Spigot	RBS		Soldered	Sd
Push-on Joint	POJ		Threaded	Thd
Restrained Push-on Joint	RPOJ		Split Flexible Coupling	SPFC
Mechanical Joint	MJ		Plasticized PVC Coupling	PPVC
Sleeve-type Flexible Coupling	SLFC			

E. Test Abbreviations

Test	Abbrev		Test	Abbrev.
Hydrostatic Test (test pressure in psig)	HYD ( )		Process Air Pipe Test (test pressure in psig)	PA ( )
Exfiltration	EX		Vacuum Test	VAC
Low-pressure Air Sewer Test	AIR		Disinfection and Bacteriological Testing	DBT
Vertical Deflection	VD		No Test Required	NR

SECTION 33 05 06

COUPLINGS, ADAPTERS AND SPECIALS

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install all couplings, adapters, and specials for process piping.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items that must be installed with or before couplings, adapters, and specials for process piping Work.

C. Related Sections:
   1. Section 33 05 05, Buried Piping Installation
   2. Section 40 05 05, Exposed Piping Installation.
   3. Section 40 05 19, Ductile Iron Process Pipe.
   4. Section 40 05 31, Thermoplastic Process Pipe.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ANSI B16.1, Cast-Iron Pipe Flanges and Flanged Fittings.
   2. ASME B31, Standards of Pressure Piping.
   3. ASTM F593, Specification for Stainless Steel Bolts, Hex Cap Screws, and Studs
   4. AWWA C606, Grooved and Shouldered Joints.
   5. ASTM C1173, Standard Specification for Flexible Transition Couplings for Underground Piping Systems.
   6. ASTM D2000, Standard Classification System for Rubber Products in Automotive Systems.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer shall have at least five years experience producing substantial similar products to those specified and shall be able to provide documentation of at least five installations in satisfactory operation for at least five years each.

B. Component Supply and Compatibility:
   1. Obtain each type of coupling, adapter, and special for process piping product included in this Section, regardless of component manufacturer, from a single couplings, adapters, and specials manufacturer.
   2. Supplier shall prepare, or review, and approve all submittals for components furnished under this Section.

3. Components shall be suitable for specified service conditions and be integrated into overall assembly by the Supplier.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Submit piping layout Shop Drawings in accordance with Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.
   2. Product Data:
      a. Submit product data on each type of coupling, expansion joint, and other piping specialties and accessories, including gaskets, hardware, and appurtenances sufficient to demonstrate compliance with the Contract Documents.
   3. Tapping Plan: Submit a complete tapping plan including, but not limited to, the following elements:
      a. Sequence and schedule of tapping operation.
      b. Means and methods of installing tap machine, sleeves and valves including area of excavation needed for tapping machine and method for supporting pipe and valve during tapping operation.
      c. Identify necessary coordination with other elements of work.
      d. Other elements of operation for safe and complete installation of tapped system.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. When requested by ENGINEER submit certificate attesting to compliance with standards referenced in this Section, signed by manufacturer.
   2. Manufacturer's Instructions:
      a. Provide instructions for handling, storing, installing, and adjusting of products.
   3. Source Quality Control:
      a. When requested by ENGINEER, submit results of source quality control tests.
   4. Qualifications Statements:
      a. Submit qualifications of manufacturer when requested by ENGINEER.

1.5 DELIVERY, STORAGE AND HANDLING

A. Refer to Section 33 05 05, Buried Piping Installation.

PART 2 PRODUCTS

2.1 COUPLINGS

A. Sleeve-type (Transition), Flexible Couplings, for water pipe 16-inches diameter and smaller:
   1. Pressure and Service: Same as connected piping.
   2. Products and Manufacturers: Provide products of one of the following:
      a. Style 253, as manufactured by Dresser Piping Specialties, part of Dresser, Inc.
      b. Style 441, by Smith Blair, Inc.
      c. Or equal.
   3. Material: Ductile Iron.
   4. Gaskets: O-ring type gaskets at each end of the sleeve.

5. Bolts and Nuts: Alloy steel, corrosion resistant, primer-coated. For buried or submerged applications, provide stainless steel bolts complete with washers complying with ASTM F593, AISI Type 316 and with nitrided stainless nuts.
6. Harnessing:
    a. Harness couplings to restrain pressure piping. For pipelines that will be under pressure, test pressures are specified in piping schedules in Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.
    b. Tie adjacent flanges with bolts of corrosion-resistant alloy steel. Provide flange-mounted stretcher bolt plates to be designed by manufacturer, unless otherwise approved. For buried or submerged applications, provide external bolting and other hardware of Type 316 stainless steel, including tie bolts, bolt plates, lugs, nuts, and washers.
    c. On plain-end piping, for harnessing couplings, provide anchor restraint system such as Dresser Piping Specialties STAR Anchor Style 443, or equal.
    d. Conform to dimensions, size, spacing, and materials for lugs, bolts, washers, and nuts as recommended by manufacturer and approved by ENGINEER for pipe size, wall thickness, and test pressure required. Provide minimum 5/8-inch diameter bolts.
7. Remove pipe stop(s) if used, unless otherwise shown or specified.

B. Sleeve-type (Transition), Flexible Couplings, for water pipe greater than 16-inches diameter:
1. Pressure and Service: Same as connected piping.
2. Products and Manufacturers: Provide products of one of the following:
    a. Style 253, as manufactured by Dresser Piping Specialties, part of Dresser, Inc.
    b. Style 441, by Smith Blair, Inc.
    c. Or equal.
3. Material: Steel.
4. Gaskets: O-ring type gaskets at each end of the sleeve.
5. Bolts and Nuts: Alloy steel, corrosion resistant, primer-coated. For buried or submerged applications, provide stainless steel bolts complete with washers complying with ASTM F593, AISI Type 316 and with nitrided stainless nuts.
6. Harnessing:
    a. Harness couplings to restrain pressure piping. For pipelines that will be under pressure, test pressures are specified in piping schedules in Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.
    b. Tie adjacent flanges with bolts of corrosion-resistant alloy steel. Provide flange-mounted stretcher bolt plates to be designed by manufacturer, unless otherwise approved. For buried or submerged applications, provide external bolting and other hardware of Type 316 stainless steel, including tie bolts, bolt plates, lugs, nuts, and washers.
    c. On plain-end piping, for harnessing couplings, provide anchor restraint system such as Dresser Piping Specialties STAR Anchor Style 443, or equal.
    d. Conform to dimensions, size, spacing, and materials for lugs, bolts, washers, and nuts as recommended by manufacturer and approved by ENGINEER for pipe size, wall thickness, and test pressure required. Provide minimum 5/8-inch diameter bolts.
7. Remove pipe stop(s) if used, unless otherwise shown or specified.

C. Transition Couplings for gravity sewer pipe:

1. Provide mechanical couplings for gravity sewer pipe in accordance with ASTM C1173 and CSA B602.
2. Pressure and Service: Same as connected piping.
3. Products and Manufacturers: Provide products of one of the following:
   a. Fernco, Strong Back.
   b. Mission.
   c. Romac.
   d. Gladding-Mcbean Repair
   e. Or equal.
4. Material: Stainless steel shield and a molded in busing.
5. Gaskets: Manufactured to meet the requirements of ASTM D 5926 or compounded for water and sewer service in accordance with ASTM D2000 MAA 610.
6. Clamps: Manufactured to meet the requirements of CSA B602. Clamp Housing and Clamp Band 301 Stainless Steel. Clamp Screw 305 Stainless Steel.

2.2 MISCELLANEOUS SPECIALTIES AND ACCESSORIES

A. Dielectric Connections:
   1. General: Where copper pipe connects to steel pipe, cast-iron pipe, or ductile iron pipe, provide either dielectric union or an insulating section of rubber or plastic pipe. When used, insulating section shall have minimum length of 12 pipe diameters.
   2. Manufacturers: Provide products of one of the following:
      a. Epco Sales, Inc.
      b. Watts Regulator Company.
      c. Capitol Manufacturing Company.
      d. Wilkins, a Zurn Company.
      e. Or equal.
   3. Ratings:
      a. Dielectric Unions: Rated for 250 psi, ANSI B16.39.
      b. Flanges: 175 psi, ANSI 16.42 (Iron), ANSI 16.24 (Bronze)
   4. Insulating Sections: Rated for same pressure as associated piping test pressure. Material shall be suitable for the application and service.
   5. Bodies and flanges, and bolts and nuts shall be steel with galvanized coating. Provide nylon insulator, brass tailpiece and EPDM gaskets.

2.3 METER SETTERS

A. General: Provide horizontal inlet and outlet meter setter, lock wing ground key angle meter valve with meter flange on inlet and angle dual check valve with meter flange on outlet. Provide bypass with lock wing ball valve and check valve.

B. Products and Manufacturers: Provide the following:
   1. Mueller Company LLC, Model H-1423-2N.
   2. Or equal.

C. Dimensions: 1-1/2” shall be 12” high by 12-1/4” length and 2” shall be 12” high by 17-1/4” length.

2.4 SERVICE SADDLES

A. Brass Service Saddles on PVC Mains:

1. General: Provide service saddle as single strap design manufactured in bronze with corporation thread outlet.
2. Manufacturers: Provide products of one of the following:
   a. Ford S-70.
   b. McDonald 3801 or 3805.
   c. Mueller H-13000 series.
   d. Romac 101B.
   e. Power Seal 3401.
   f. Or equal.

B. Ductile Iron Service Saddles:
1. General: Provide service saddle manufactured in ductile iron with corporation thread outlet.
2. Manufacturers: Provide products of one of the following:
   a. Double Strap:
      1) Ford F202.
      2) Smith-Blair 313.
      3) JCM Industries 402.
      4) Romac 202U.
      5) PowerSeal 3413DI.
      6) Or equal.
   b. Stainless Steel Strap:
      1) Ford FCD202.
      2) Smith-Blair 317.
      3) JCM Industries 405.
      4) Romac 202S.
      5) PowerSeal 3417DI.
      6) Or equal.

C. Stainless Steel Service Saddles:
1. General: Provide service saddle manufactured in stainless steel with corporation thread outlet.
2. Manufacturers: Provide products of one of the following:
   a. Ford FS323.
   b. Romac 304.
   c. Or equal.

2.5 METER BOXES

A. General: Provide meter boxes for all meters as required.

B. Manufacturers: Provide products of one of the following:
1. Size of meter ¾", residential, provide box manufactured of polyethylene plastic using the structural foam method of construction. The cover shall be manufactured of cast iron (LYLV244-233-LL-G as manufactured by Ford Meter Box Company, or equal).
2. Size of meter ¾", irrigation, provide box manufactured of polyethylene plastic using the structural foam method of construction. The cover shall be two piece, lock down, manufactured of cast iron (DG218-243 as manufactured by Ford Meter Box Company, or equal).

3. Size of meter 1”, provide box manufactured of cast iron. The cover shall be lock down, manufactured of cast iron (LYLBB144-444-G-NL as manufactured by Ford Meter Box Company, or equal).
4. Size of meter 1-1/2” and 2”, provide box manufactured of polymer concrete meeting ANSI/SCTE-77 Tier 22 (Model 1730 as manufactured by Oldcastle Infrastructure, or equal).

2.6 PAINTING

A. Shop Painting:
   1. Clean and coat ferrous metal surfaces of products in the manufacturer’s shop in accordance with the following
      a. For Submerged items: Prime Coat, first coat, and second coat of paint shall be Dura-Plate 235 Multipurpose Epoxy B67-235 B67V235 Hardener
         1) Dry Mills: 4-6 mils for each coat
      b. For Non-Submerged Items: Prime Coat and first coat of paint shall be Dura-Plate 235 Multipurpose Epoxy B67-235 B67V235 Hardener. The Second coat shall be Hi-Solids Polyurethane B65-300 Series Color, B60V30 Hardener or Acrolon 218 HS Acrylic Polyurethane B65-600 Series B65V600 Hardener.
         1) Prime Coat, Dry Mills: 4-6 Mils.
         2) First Coat, Dry Mills: 4-6 Mils.
         3) Second Coat, Dry Mills: 3-4 Mils.
   2. Coat machined, polished and non-ferrous surfaces bearing surfaces and similar unpainted surfaces with corrosion prevention compound that shall be maintained during storage and until products are placed into operation.

PART 3 EXECUTION

3.1 INSPECTION

A. Inspect materials for defects in material and workmanship. Verify compatibility of products with pipe, fittings, valves, and appurtenances.

3.2 INSTALLATION

A. Installation:
   1. Install piping specialties in accordance with the Contract Documents and manufacturer’s instructions.
   2. For buried installations, refer to Section 33 05 05, Buried Piping Installation.
   3. For exposed installations, refer to Section 40 05 05, Exposed Piping Installation.

B. Adjust joints as required to ensure that expansion joints will be fully extended when ambient temperature is at minimum operating temperature, and fully compressed at maximum operating temperature for the system in which expansion joints are installed.

END OF SECTION

SECTION 33 05 13

MANHOLES AND STRUCTURES

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all precast and cast-in-place manholes.

B. General:
   1. Manholes and structures shall conform in shape, size, dimensions, material, and other respects to the details shown or as directed by ENGINEER.
   2. Cast-iron frames, grates and covers shall be the standard frame and grate or cover unless otherwise shown and shall be as specified in Section 05 56 00, Metal Castings.
   3. Concrete for cast-in-place manholes and structures and for inverts in precast and masonry manholes and structures shall be Class “A” and shall conform to the requirements specified under Section 03 00 05, Concrete.
   4. All manholes and structures shall be precast construction, unless otherwise shown. All sanitary or process manholes and structures carrying untreated wastewater shall be PVC lined or coated with Saueriesen or Sewer Shield 100 or Tnemec Perma-Shield 431.

C. Related Sections:
   1. Section 03 00 05, Concrete.
   2. Section 05 56 00, Metal Castings.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American Society for Testing and Materials, (ASTM).
      a. ASTM A139, Standard Specification for Electric-Fusion (Arc)-Welded Steel Pipe (NPS 4 and Over)
      b. ASTM C32, Specification for Sewer and Manhole Brick (made from Clay or Shale).
      c. ASTM C398, Standard Practice for Use of Hydraulic Cement Mortars in Chemical-Resistant Masonry.
      d. ASTM C443, Specification for Joints for Concrete Pipe and Manholes, Using Rubber Gaskets.
      e. ASTM C478, Specification for Precast Reinforced Concrete Manhole Sections.
      f. ASTM C923, Standard Specification for Resilient Connectors Between Reinforced Concrete Manhole Structures, Pipes, and Laterals.
   2. American Water Works Association, (AWWA).
      a. AWWA C203, Coal-Tar Protective Coatings and Linings for Steel Water Pipelines - Enamel and Tape - Hot Applied
      b. AWWA C302, Reinforced Concrete Pressure Pipe, Non-cylinder Type, for Water and Other Liquids.
   3. National Precast Concrete Association
      a. Manhole Invert Channels; Tech Notes.

1.3 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Submit drawings showing design and construction details of all precast concrete and cast-in-place manholes and structures, including details of joints between the manhole bases and riser sections and stubs or openings for the connections.
      b. Submit drawings for slab and wall reinforcing for 6-foot diameter and larger manholes for approval.
      c. Submit drawings of strap on vents, mountings straps and anchor
   2. Submit manufacturer's certification for 1,000-pound pull-out test for each manhole step with each shipment. Certification shall include manhole location, date of test and results.

PART 2 PRODUCTS

2.1 PRECAST CONCRETE MANHOLES AND STRUCTURES

A. Precast manholes and structures shall conform to the details shown. Provide cast-in-place concrete bases if shown on the drawings.

B. Except where otherwise specified precast manhole components shall consist of reinforced concrete pipe sections especially designed for manhole construction and manufactured in accordance with ASTM C 478, except as modified herein.

C. Precast, reinforced concrete manhole bases, riser sections, flat slabs and other components shall be manufactured by wet cast methods only, using forms which will provide smooth surfaces free from irregularities, honeycombing or other imperfections.

D. Joints between manhole components shall be the tongue and groove type and shall conform to ASTM C443. Joints shall be sealed by employing a single, continuous rubber O-ring gasket and shall conform to ASTM C443 or with butyl rubber sealants conforming with ASTM C990. Butyl rubber sealant shall be "Rubber Seal" as manufactured by Ru Van, Inc., or approved equal. The circumferential and longitudinal steel reinforcement shall extend into the bell and spigot ends of the joint without breaking the continuity of the steel. Joints between the base sections, riser sections and top slabs of manholes 72-inches in diameter and less shall be rubber and concrete joints. Joints for manhole components greater than 72-inches in diameter shall be provided with steel bell and spigot rings.

E. All precast manhole components shall be of approved design and of sufficient strength to withstand the loads imposed upon them. They shall be designed for a minimum earth cover loading of 130 pounds per cubic foot, an HL-93 wheel loading, and an allowance of 30 percent in roadways and 15 percent in rights-of-way for impact. Manhole bases shall have two cages of reinforcing steel in their walls, each of the area equal to that required in the riser sections. Wall thickness shall be a minimum of $1/12^{th}$ of the inside diameter of the manhole and not be less than 5-inches. Concrete top slabs shall not be less than 8-inches thick.

F. Lifting holes, if used in manhole components, shall be tapered, and no more than two shall be cast in each section. Expansion grout shall be furnished to seal the lifting holes. The lifting holes shall be made to be sealed by expansion grout from the outside face of the section only.

G. The point of intersection (P.I.) of the sewer pipe centerlines shall be marked with 1/4-inch diameter steel pin firmly enclosed in the floor of each manhole base and protruding approximately 1-inch above the finished floor of the base.

H. Mark date of manufacture and name or trademark of manufacturer on inside of each section.

I. The barrel of the manhole shall be constructed of various lengths of riser pipe manufactured in increments of one foot to provide the correct height with the fewest joints. Openings in the barrel of the manholes for sewers or drop connections will not be permitted closer than one foot from the nearest joint. Special manhole base or riser sections shall be furnished as necessary to meet this requirement.

J. A precast slab or eccentric or concentric cone, as shown or approved, shall be provided at the top of the manhole barrel to receive the cast iron frame and cover.

K. Eccentric cones with bolt down frame and cover shall have a minimum vertical height, as measured from the top of the cone to the bottom of the bell, of 32-inches. Eccentric cones without bolt down frame and cover to be installed flush to finish grade shall have a minimum vertical height of 24-inches.

L. Concentric cones with a vertical height of 20-inches may be used on 4-foot diameter manholes less than 5-feet deep.

M. Transition cone sections for an eccentric transition from a 60-inch riser to a 48-inch cone section shall be placed directly beneath the 48-inch cone.

N. Transition slabs for 6-foot diameter and larger manholes to be buried shall be placed a minimum of 5-feet above the invert shelf. Flat top slabs for 6-foot and larger diameter manholes shall not be used if manhole is located within pavement or maintained lawns.

O. Connectors between manholes and pipe shall be standard mechanical boot type connectors, conforming to ASTM C923, which allow for the expansion ring at the manhole wall to be completely seated in a vertical plane. Compression type connectors shall not be used.
   1. Approved Manufacturers of mechanical boot type connectors include:
      a. Quik-LOK by A-LOK Products, Inc.
      b. G-3 by A-LOK Products, Inc.
      c. Or Approved Equal.

P. Grading Rings: Modular precast concrete and lined with same materials as manhole.

Q. Flexible Joints: Comply with ASTM C923.

2.2 MASONRY COMPONENTS

A. Masonry Work, where shown or otherwise approved by ENGINEER, shall conform to the following:
   1. Brick shall conform to the requirements of: ASTM C32, Grade MS for manhole brick.
   2. Mortar shall be portland cement 1:3 mix and in accordance with ASTM C398.
   3. Cement shall be Type II portland cement as specified for concrete masonry.

2.3 MISCELLANEOUS METALS

A. Metal frames and covers and similar required items shall be provided as shown and in accordance with Section 05 56 00, Metal Castings.

2.4 DROP CONNECTIONS

A. Drop connections for manholes and structures shall be constructed where shown or directed by the ENGINEER and shall conform to the design and details shown. Concrete for pipe encasement shall be Class “B” as specified under Section 03 00 05, Concrete. Concrete shall be bonded to manhole in the manner shown or otherwise approved by ENGINEER.

B. Pipe for inside drop connections shall be SDR 35 PVC.

C. Drop connections shall not enter the manhole in the cone section.

D. Outside drops shall only be installed to address elevation differences of minimum 2-feet. The influent pipe of an outside drop shall be a minimum pipe length of 18-feet.

E. Inside drop connections shall only be installed when safety considerations or work space limitations preclude installing an outside drop connection, and with Engineer approval. Inside drops shall not be installed on 4-foot diameter manholes.

2.5 MANHOLE STEPS

A. Provide access steps on all manholes with eccentric cones.

B. Steps shall be copolymer polypropylene and conform to ASTM C478 and current OSHA regulations.

C. Steps and common straight wall of manholes with eccentric cones and flat slab tops shall be located over widest shoulder of manhole invert.

2.6 MANHOLE VENT PIPES

A. Furnish 5-inch welded steel vent pipes as shown on the drawings. Unless otherwise specified, vent pipe shall be Schedule 40, grade “B” steel in conformance with ASTM A139, with minimum yield strength of 35,000 pounds per square inch.

B. Vent pipes shall have inside coal tar lining of minimum 0.094-inch thickness in conformance with AWWA C203. Alternatively, a coal tar epoxy lining of minimum 0.024-inch dry film thickness may be used. Coal tar epoxy lining shall be: Kloppers No. 300M, Americoat No. 78, Carboline-Carbomastic No. 14, or Equal.

C. The outside surface of vent pipes shall be sand or grit blasted to commercial standard and have 1 coat of zinc chromate primer applied in conformance with Federal Specification TT-86A. Vent pipes shall be finished with 2 evenly applied coats of rust-inhibiting enamel paint. Paint to be: Kloppers Glamortex No. 501 olive green enamel, Southern Coatings Rustolay No. 5037 garden green enamel, or Equal.

D. Vent pipes shall be flanged by plain end and cast in place with bolt holes in flange straddling the vent center lines.

E. 5-inch diameter steel vent pipe shall be furnished with compatible, coated flange and all necessary hardware for bolted attachment.

PART 3 EXECUTION

3.1 MANHOLE BASES

A. Cast-in-place bases shall be placed on suitable foundations after the pipes are laid. They shall be cast monolithically to an elevation at least 12-inches above the top of the highest pipe entering the manhole, except where a drop connection is to be installed. Base, walls and bottom shall be at least of the thickness shown and reinforced to withstand the loads to be expected. Connections for sewer pipes shall conform to the details shown.

B. Precast bases shall be set on a crushed stone or crushed gravel or concrete foundation as shown. Precast bases shall be set at the proper grade and carefully leveled and aligned.

3.2 PRECAST MANHOLE SECTIONS

A. Set sections vertical with steps and sections in true alignment. The base of the bell or groove end at joints between components shall be buttered with 1:2 cement-sand mortar to provide a uniform bearing between components. All joints shall be sealed with cement mortar inside and out and troweled smooth to the contour of the wall surface. Raised or rough joint finishes will not be accepted.

B. Install sections, joints and gaskets in accordance with manufacturers recommendations.

C. Lifting holes shall be plugged with expansion grout from the outside of the barrel prior to backfilling.

3.3 MANHOLE CHANNELS

A. All invert channels through manholes and structures shall be constructed of Class “A” concrete. Channels shall be properly formed to the sizes, cross sections, grades and shapes shown or as ordered. Benches shall be built up to the heights shown or as directed by the ENGINEER and given a uniform wood float finish. Care shall be taken to slope all benches for proper drainage to the invert channel.

3.4 GRADING RINGS

A. Grading rings shall be used for all precast manholes, where required. Stacks or grade rings shall be a maximum of 21-inches in height, constructed on the roof slab or cone section on which the manhole frame and cover shall be placed. The height of the stack or grade rings shall be such as required to bring the manhole frame to the proper grade. Brick shall not be used to adjust rim elevations of above-grade manholes.

B. Each grade ring shall be laid in a full bed of mortar and shall be thoroughly bonded.

C. The outside grading rings shall be neatly plastered with 1/2-inch of cement mortar as the Work progresses.

3.5 MANHOLE FRAMES AND COVERS

A. Frames and covers shall be anchored to manhole with Red Jacket masonry anchors (or Equal) and thoroughly sealed to concrete with tar sealant putty.

B. Anchor sleeve threaded stud and nut shall be stainless or galvanized steel.

C. Provide bolt down covers as indicated on the Drawings.

3.6 STUBS FOR FUTURE CONNECTIONS

A. As shown or required for connections, cast iron sleeves, bell end tile, ductile iron or reinforced concrete pipe stubs with approved watertight plugs shall be installed in manholes and structures. Where pipe stubs, sleeves or couplings for future connections are shown or directed by the ENGINEER, CONTRACTOR shall provide all materials and labor in order to complete the Work.

3.7 FALSE WALLS

A. False walls shall be constructed in manholes when shown on the Drawings. Holes of the appropriate size shall be cored or blocked out in the manhole wall at the elevation and alignment shown on the Plans. A four-inch thick masonry wall shall be constructed in the opening. Inverts shall be constructed to match proposed pipe elevations and alignments and permit installation of the future extension without demolition work other than removal of the false wall

3.8 GRADING AT MANHOLES AND STRUCTURES

A. All manholes and structures in unpaved areas shall be built, as shown or directed by the ENGINEER, to an elevation higher than the original ground. The ground surface shall be graded to drain away from the manhole. Fill shall be placed around manholes to the level of the upper rim of the manhole frame, and the surface evenly graded on a 1 to 5 slope to the existing surrounding ground, unless otherwise shown or directed by the ENGINEER. The slope shall be covered with 4-inches of topsoil, seeded and maintained until a satisfactory growth of grass is obtained.

B. Manholes and structures in paved areas shall be constructed to meet the final surface grade. In paved areas on State Highways, all manholes and structures shall be 1/2-inch below final wearing surfaces. Manholes and structures shall not project above finished roadway pavements.

C. CONTRACTOR shall be solely responsible for the proper height of all manholes and structures necessary to reach the final grade at all locations. CONTRACTOR is cautioned that ENGINEER'S review of Shop Drawings for manhole components will be general in nature and CONTRACTOR shall provide an adequate supply of random length precast manhole riser sections to adjust any manhole to meet field conditions for final grading.

3.9 MANHOLE WATERTIGHTNESS

A. All manholes and structures shall be free of visible leakage. Each manhole shall be tested for leaks and inspected, and all leaks shall be repaired in a manner subject to ENGINEER'S

approval. Manhole testing shall conform to the requirements of Section 33 05 05, Buried Piping Installation.

3.10 FLEXIBLE PIPE JOINT AT MANHOLE BASE

A. Provide a flexible joint between each pipe entering and exiting the manhole. This may be accomplished by the installation in the manhole base of the bell end of a pipe or by other means subject to approval of ENGINEER. Joints shall be similar to the approved pipe joints. The joint into the manhole base shall be completely watertight.

3.11 PIPE JOINT AT MANHOLE BASE

A. Pipe openings shall be maximum 3-inches larger than outer diameter of pipe.

B. Openings shall be reinforced with minimum 2-square inches of steel bent to a 90-degree angle.

C. Pipe shall be centered about opening and supported by a concrete collar 12-inches greater than the outer diameter of the pipe. Collar shall extend 12-inches from the outside of the manhole wall. Collar shall be reinforced from the outside to become an integral part of the manhole invert or to a point flush with the inside wall of the manhole.

END OF SECTION

SECTION 33 05 23.17

UTILITY BORING AND JACKING

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
1. Design, furnish and install the proposed piping alignment by jacking and boring construction methods, as shown on the Drawings and conform to this specification. The work includes, but not limited to, survey, design, excavation, dewatering, removal of all materials encountered in the jacking and boring operations, disposal of all material not required in the work, grouting bulkheads, testing, cleaning, restoration, and incidentals as shown on the Drawings and as specified herein.
2. Install all jointing and gasketing materials, specials, flexible couplings, mechanical couplings, harnessed and flanged adapters, sleeves, tie rods, and all other Work required to complete the jack and bore, or tunneling installations.
3. The jacking and boring construction method shall consist of pushing (jacking) the casing pipe into the earth with a boring auger rotating with the casing/pipe to remove the spoil. The operations are to be completed while simultaneously providing ground stabilization techniques. Include provisions for preventing uncontrolled inflow of loose or saturated soils.
4. Provide additional geotechnical/subsurface investigations required to establish the appropriate parameters (i.e., limiting pressures, setback distances, depth of cover, etc.) for completing the design of the jacking and alignment, as specified herein.
5. OWNER is responsible for obtaining the required general construction permits, easements, and approvals from the South Carolina Department of Transportation (SCDOT), York County, and any respective property owners within the alignment. When encasement pipe is installed in the state rights-of-way, the entire installation shall be as required by SCDOT.

B. Coordination:
1. Review installation procedures under other Sections and other contracts and coordinate with the Work that is related to this Section.
2. Coordinate construction activities with the respective authorities.

C. Related Sections:
1. Section 31 23 05, Excavation and Fill.
2. Section 33 05 05, Buried Piping Installation.
3. Section 40 05 19, Ductile Iron Process Pipe.
4. Section 40 05 31, Thermoplastic Process Pipe.

1.2 REFERENCES

A. Standards referenced in this Section are:
1. ASTM A139, Standard Specification for Electric-Fusion (Arc)-Welded Steel Pipe (NPS 4 and Over).
2. ASTM D1248, Standard Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable.
3. ANSI/AWWA C151, Ductile Iron Pipe, Centrifugally Cast.
4. ANSI/AWWA C600, Installation of Ductile-Iron Mains and Their Appurtenances.

1.3 QUALITY ASSURANCE

A. Demonstrate expertise in “trenchless” methods by providing a list of five (5) utility references for which similar work has been performed in the last two years. The references should include a name and telephone number where contact can be made to verify the CONTRACTOR’s capability. Provide documentation showing successful completion of the projects used for reference. Conventional trenching experience will NOT be considered applicable.

B. All supervisory personnel must be adequately trained and have at least ten years of experience in jack and boring operations. Submit the names and resumes of all supervisory field personnel prior to the start of construction.

C. ENGINEER will base the review of submitted details and data on the requirements of the completed work, safety of the work in regard to the public, potential for damage to public or private utilities and other existing structures and facilities, and the potential for unnecessary delay in the execution of the work. Such review shall not be construed to relieve the CONTRACTOR in any way of the CONTRACTOR’s responsibilities under the contract.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Jacking and Boring Plan describing the equipment, methods, operational procedures, construction sequence, contingency plans, and other items of concern to be performed during the jacking and boring construction.
   2. Project Safety Plan, including, but not limited to, monitoring for gases encountered, hazardous chemical list, and all MSDS and technical data sheets.
   3. Submit site layout, equipment arrangement, and entry/exit pits drawings and technical specifications of the machine and equipment (including any modifications) proposed.
   4. Submit Construction drawings, Specifications, and Contingency plans on the following items:
      a. Complete details of the site clearing, excavation, drainage, security, and equipment mobilization including, but not limited to, the methods, procedures and equipment arrangement to be used during the construction.
      b. Complete details and drawings, and calculations of the significant factors and constraints associated with jacking and boring installations including, but not limited to, fluid pressures, jacking forces, pipe capacities, jacking and receiving pits shoring design, etc.
      c. Provide plan and profile of the proposed jacking and boring alignments, indicating depth, angle of deflection, and radius of all pipe bends along the alignment.
      d. Complete details of the grouting techniques/methods to be utilized for filling grout into the annulus between the adjacent soils and the outside of the casing piping, including but not limited to, fitting procedures, equipment, pumping procedures, fluid pressures, mixtures and plug systems. Also include methods of monitoring and controlling the grouting pressures.
      e. Method of monitoring and controlling the specified line and grade of excavation including, but not limited to, the methods, procedures, reliability, and necessary ancillary equipment to be used during construction operations.
      f. Complete details of the groundwater control, launching seals, muck/spoils containment, dewatering, drying, and removal including, but not limited to, the methods, procedures, equipment, contingency plans and off-site disposal location.

g. Complete details of the casing and carrier piping capacities, maximum jacking loads, storage, assembly, and installation including, but not limited to, the methods, procedures, and equipment to be used.
h. The type of spoils separation system to be used.
i. Information regarding the inject lubricant to be used for the jacking portion of the Work.

B. Informational Submittals: Submit the following:
1. Certificates:
a. Certificate signed by manufacturer of each product certifying that product conforms to applicable referenced standards.
2. Field Quality Control Methods: At least 10 days prior to the start of the jacking and boring, submit a description of quality control methods proposed to use during the operations to the ENGINEER. Describe:
a. Procedures for controlling and checking line and grade.
b. Field forms for establishing and checking line and grade.
3. Bring to the attention of the ENGINEER any known discrepancies with actual jacking and boring methods that will be performed. This shall be stated, in writing, to ENGINEER no later than the pre-construction meeting.

C. Closeout Submittals:
1. Maintain accurate and up-to-date record documents showing modifications made in the field, in accordance with approved submittals, and other Contract modifications relative to boring and jacking Work. Submittal shall show actual location of all boring and jacking Work and appurtenances at same scale as the Drawings.
2. Show piping with elevations referenced to Project datum and dimensions from permanent structures.
3. Include profile drawings with boring and jacking record documents when the Contract Documents include boring and jacking profile drawings.
4. Submit record drawings prior to the time of Substantial Completion.

1.5 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Do not place/store materials, equipment, or personnel on or around state roads.

B. Deliver materials to the site to ensure uninterrupted progress of the Work.

C. Handle all pipe, fittings, specials and accessories carefully with approved handling devices. Handling devices shall include ropes, fabric, or rubber-protected slings and straps. Chains, cables, or hooks inserted into the pipe ends shall NOT be used. Two slings spread apart shall be used for lifting each length of pipe. Do not drop or roll material off trucks.

D. Store pipes and fittings on heavy wood blocking or platforms so they are not in contact with the ground. Space pipe supports suitably and of such widths as not to allow deformation of the pipe at the point of contact with the supports.

E. Limit stacking of pipe to a height that will not cause deformation of the bottom pipes under anticipated temperature conditions.

F. Securely cap/plug all ends of stored piping to prevent entry of soil, debris, and vermin.

PART 2 PRODUCTS

2.1 EQUIPMENT

A. Jack and Boring System, General:
   1. The jack and boring system shall consist of, but not limited to, the following components:
      a. Jacking system suitable for forcing the casing through the embankment.
      b. Auger Boring and Spoil removal system.
      c. Pipe lubrication system.
   2. The excavation equipment and system shall be fully capable of excavating and removing all material that will be encountered during the construction operations.
   3. The automated spoil transportation system shall match the excavation rate to the rate of spoil removal, maintaining settlement or heave within tolerances specified herein.
      a. If a slurry spoil transportation system is used, the groundwater pressure may be managed by use of the slurry pumps (which may be variable speed), pressure control valves and a flow meter. A slurry bypass unit shall be included in the system to allow the direction of flow to be changed and isolated, as needed. A solids separation process shall be provided when using slurry transportation systems. The process shall be designed to provide adequate separation of the spoil from the slurry so that the clean slurry can be returned to the cutting head for reuse.
      b. If an Auger spoil transportation system is utilized, the groundwater pressures may be managed by controlling the volume of spoil removal with respect to the advance rate (Earth Pressure Balance Method) and the application of compressed air. In soils with excessive groundwater, approval of the ENGINEER shall be required for the earth pressure balance auger systems. Approval shall be based on the evaluation of the equipment's ability to balance soil and groundwater pressures at the face, stability of the soils and the significance of the groundwater present.

B. Pipe Jacking Equipment:
   1. The main jacks shall be mounted in a jacking frame and located in the drive (starting) shaft. The jacking frame successively pushes the steel casing pipes toward a receiving shaft. The jacking capacity shall be sufficient to push the auger/boring machine and/or length of casing piping through the ground.
   2. The main jacking equipment installed shall have a capacity greater than the anticipated jacking load. The hydraulic cylinder extension rate shall be synchronized with the excavation rate of the boring, which shall be determined by the specific soils conditions.
   3. The CONTRACTOR shall provide intermediate jacking stations when the total anticipated jacking force needed to complete the installation exceeds the designed maximum jacking force of the pipe.

C. Pipe Lubrication System:
   1. Utilize a pipe lubrication system when anticipated jacking forces on the pipe are expected to exceed the capacity of the main jacks or exceed the pipe design strength with the appropriate safety factor. A prior approved lubricant shall be injected at the rear of the auger, or boring machine and, if necessary, through the casing pipe walls to lower the friction developed on the surface of the pipe during jacking.

2.2 MATERIALS

A. Carrier Piping:
   1. Carrier piping used for the conveyance of water and wastewater shall refer to Sections 33 05 05, Buried Piping Installation, and 40 05 19, Ductile Iron Pipe, or 40 05 31, Thermoplastic Pipe, for material and installation specifications.
   2. All ductile iron carrier pipe installed with joint inside an encasement pipe must utilize rigid restrained joints.
      a. Approved Manufacturers:
         1) US Pipe Mech-Lok.
         2) US Pipe MJ Harness-Lok.
         3) Approved equal.
   3. All PVC carrier pipes shall have restrained joints with a working pressure at least equal to that of the PVC pipe on which it is to be installed and a minimum safety factor of 2:1.
      a. Approved Manufactures:
         1) EBAA Iron, Inc. Series 2000PV ductile iron MEGALUG retainers with Mega-Bond Coating System.
         2) Approved equal.

B. Steel Casing Piping:
   1. Casing pipe and joints shall be constructed so as to prevent leakage of any substance from the casing throughout its length.
   2. Use only new, welded or seamless steel pipe per ASTM A-139, Grade B. Casing minimum thickness to be as shown on the Drawings. The casing wall thickness shall be designed to accommodate the maximum jacking load allowed, as well as the expected earth and live loads.
   3. Joints in steel casing pipe shall be butt-welded joints, conforming to the requirements of AWWA C206. Pipe 36 inches in diameter and larger shall be welded both inside and outside of the pipe/casing.
   4. After welding, the joint and the surrounding damaged or uncoated area shall be coated with the same material and to the same thickness as the shop applied coating.
   5. All steel casing pipe and welds shall meet or exceed either the site-specific regulatory agency's requirement, or the manufacturer's minimum wall thickness to meet or exceed the greater of either: installation (jacking), loading, or carrier load requirements.
   6. The size (diameter) of the steel casing shall be as shown on the Drawings.
   7. All steel pipes shall be designed for the external and internal loads to which they will be subjected. Steel casing shall meet ASTM specifications and be designed to meet or exceed a minimum live load of a Cooper E-80 loading. The loading consists of 80 kip (356 kN) axle loads spaced 5-feet (1.5 m) on centers.

C. Annular Spacers
   1. Support carrier pipe within the steel casing by means of annular spacers. Casing spacers shall prevent the carrier pipe from floating, and shall electrically insulate the carrier pipe from the casing.
   2. The annular spacers shall be made of non-corrodible materials such as HDPE or stainless steel.
   3. For steel spacers, runners shall be made of polyethylene to provide dielectric insulation between the spacer and the carrier pipe.
   4. Spacers shall be installed at minimum one behind the bell end and one in the center of each 18-ft or 20-ft joint of carrier pipe in accordance with the manufacturer's recommendations.
   5. Verify size, position, spacing, and configuration of spacers with manufacturer. Final spacer installation shall be based on approved submittal.

6. Verify the tolerances of the casing spacer are compatible with the carrier pipe's outside diameter including provisions for the pipe to be slightly out-of-round.
7. Wooden skids are not acceptable.

D. Grout (Annular Backfill, between casing and adjacent soils):
1. Grout shall consist of one (1) part Portland cement, three (3) parts sand and the minimum amount of water necessary to obtain the desired consistency; and all grout mixtures shall contain 2% of bentonite by weight of the cement.
2. If voids are encountered or occur outside the encasement pipe, grout connections shall be provided and regularly spaced at 10-feet on center in the top section of the encasement pipe.

E. Casing End Seals
1. Seals shall be standard wrap-around end seals, manufactured of synthetic rubber, with self-curing rubber sealing strips.
2. The end seals shall be provided with 316- stainless steel bands and clamps.

PART 3 EXECUTION

3.1 INSTALLATION

A. General:
1. Provide notice of intent to begin Bore and Jack operations to ENGINEER prior to beginning any Work in roadway or railway rights-of-way. Acknowledgement of intent must be received no less than 5 working days before Work begins.
2. Comply with the lawful requirements of SCDOT, York County, public agencies, and owners of public utilities or other facilities respecting the safeguarding of structures and improvements that might be endangered by the jacking and boring, or microtunneling construction operations.
3. Install the required steel casing by means of jacking and boring as shown, specified herein, and as recommended by the pipe manufacturer.
4. The jacking and boring operation, along with the installation of the casing pipe, shall be done simultaneously and continuously until the casing pipe is in final position.
5. CONTRACTOR shall be responsible for the CONTRACTOR's means and methods of jacking and boring, and shall ensure the safety of the work, the CONTRACTOR'S employees, the public, and adjacent property, whether public or private.
6. Maintain traffic flow at all times during the progress of the work. CONTRACTOR shall provide adequate signs, barricades, flag persons, lights and other control devices in accordance with the provisions and requirements of the SCDOT standards. No lanes of traffic shall be closed without prior approval.
7. Provide erosion and sediment control to minimize erosion and the transport of sediment beyond the limits of the work area.
8. Anticipate that portions of the jacking and boring excavation will be below the groundwater table and dewatering will be required.
9. Comply with all local, state, and federal laws, rules, and regulations at all times to prevent pollution of the air, ground, and water.
10. Locate, mark and protect existing utilities and facilities in the work area. Perform test pits as required.

11. If there is a conflict between manufacturer's recommendations and the Drawings or Specifications, request instructions from ENGINEER in writing, before proceeding.

B. Jacking and Boring Operations:
   1. Provide and maintain adequate boring equipment and install support systems as required.
   2. The boring operations shall consist of excavating the embankment material ahead of the casing, removing excavated material through the pipe and forcing the pipe through the embankment with jacks into the spaced provided. No jetting, sluicing, or wet boring is permitted.
   3. Required launching and receiving pits/shafts shall be excavated and maintained to the minimum dimensions necessary to perform the operations and allow for safe working practices.
   4. The pits or shafts shall be adequately barricaded, sheeted, braced, dewatered, and ventilated as required, in accordance with applicable specifications and regulations.
   5. CONTRACTOR to use thrust blocks designed to distribute loads in a uniform manner so that any deflection of the thrust block is uniform and does not impart excessive load on the shaft itself or cause the jacking frame to become misaligned.
   6. Position jacks so that the resultant force is applied along the centerline of the casing pipe, and force is applied evenly to the entire end of the pipe.
   7. Backstops shall be provided for adequately distributing the jack thrust without causing deformation of the soil or other damage.
   8. CONTRACTOR to monitor and control the jacking pressure/force applied to ensure that pipe manufacturer’s recommended limits are not exceeded.
   9. CONTRACTOR responsible for all testing, survey, and documentation of the pre/post construction site conditions, in which to provide as a basis of comparison for the post construction conditions to be evaluated.
   10. Once jacking has begun, the operation must continue without interruption, insofar as practical, to prevent the pipe from becoming firmly set in the embankment.

C. Steel Casing Installation
   1. The installation of the casing shall be in accordance with manufacturer’s recommendations and subject to the approval of the agency having jurisdiction.
   2. The casing pipe shall be adequately protected to prevent crushing or other damage under the jacking pressures. Provide timbers for cushioning between the pipe pushed end and the jacking equipment.
   3. The casing installation shall produce NO upheaval, settlement, cracking, movement, or distortion of the existing roads.
   4. Install casing piping concurrent with the bore, as earth is removed.
   5. After the installation of the casing piping, the CONTRACTOR shall inject grout through the grout connections in such a manner as to completely fill all voids outside the casing pipe resulting from the jacking and boring operations. Grout pressure shall be controlled and monitored, so as to avoid deformation of the steel casing and avoid movement of the surrounding ground. After completion of the grouting operations, the grout connections shall be closed with cast-iron threaded plugs.

D. Carrier Pipe Installation
   1. All joints of the carrier piping, within the casing, shall be restrained in accordance with the Section 40 05 19, Ductile Iron Process Pipe or Section 40 05 31, Thermoplastic Process Pipe.
   2. Clean all dirt and debris from the casing piping.

3. Attach the centered/restrained casing spacers/guides to the carrier pipe sections, as required to prevent excessive sag, bending, shear stress and to support the pipe barrel in accordance with pipe manufacturer's recommendations. Piping is NOT to be supported by bells/joints.
4. Provide casing spacers at each joint, 6-inches from each side of joint, and at minimum 10-feet intervals, or as recommended by manufacturer. There shall be a minimum of two (2) casing spacers installed on each section of pipe.
5. Lubricant for pipe guides shall be drilling mud or flax soap. Petroleum, or Oil based products are NOT allowed.
6. The CONTRACTOR shall protect and preserve the interior surfaces of the steel casing from damage.
7. CONTRACTOR to provide casing end seals, and secure seals in place with stainless steel bands in accordance with the manufacturer's recommended procedures. The installation shall be watertight.

E. Transitions from One Type of Pipe to Another:
1. Provide all necessary adapters, specials and connection pieces required when connecting different types and sizes of pipe or connecting pipe made by different manufacturers.

3.2 WORK AFFECTING EXISTING PIPING

A. Location of Existing Piping:
1. Locations of existing piping shown should be considered approximate. Determine the true location of existing piping to which connections are to be made, and location of other facilities which could be disturbed during earthwork operations, or which may be affected by CONTRACTOR'S Work in any way.
2. Conform to applicable requirements of the General Conditions, and Section 01 73 29, Cutting and Patching, pertaining to cutting and patching. Conform to applicable requirements of Section 01 14 16, Coordination with Owner's Operations, pertaining to connections to existing facilities.

END OF SECTION

SECTION 33 11 00

WATER SERVICES

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment and incidentals as shown, specified, and required to furnish and install domestic water piping systems complete with accessories.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before, the domestic water piping systems Work.

C. Related Sections:
   1. Section 33 05 05, Buried Piping Installation.
   2. Section 40 05 19, Ductile Iron Process Pipe.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. ANSI A13.1, Scheme for Identification of Piping Systems.
   2. ANSI B16.15, Cast Copper Alloy Threaded Fittings: Classes 125 and 150.
   3. ANSI B16.18, Cast Copper Alloy Solder Joint Pressure Fittings.
   4. ANSI B16.22, Wrought Copper and Copper Alloy Solder-Joint Pressure Fittings (ASME B16.22).
   5. ANSI B16.23, Cast Copper Alloy Solder Joint Drainage Fittings: DWV.
   6. ANSI B16.26, Cast Copper Alloy Fittings for Flared Copper Tubes.
   7. ANSI B16.29, Wrought Copper and Copper Alloy Solder-Joint Drainage Fittings: DWV.
   8. ANSI B16.39, Malleable Iron Threaded Pipe Unions: Classes 150, 250 and 350.
   9. ANSI B40.1, Gages – Pressure Indicating Dial - Elastic Element.
   10. ANSI H 23.1, Seamless Copper Water Tube, (ASTM B 88).
   11. ASSE 1013, Performance Requirements for Reduced Pressure Principle Backflow Preventers and Reduced Pressure Fire Protection Principle Backflow Preventers.
   12. ASSE 1018, Trap Seal Primer Valves – Water Supply Fed.
   13. ASTM A 307, Specification for Carbon Steel Bolts and Studs, 60,000 PSI Tensile Strength.
   14. ASTM B 32, Specification for Solder Metal.
   15. ASTM B 62, Specification for Composition Bronze or Ounce Metal Castings.
   16. ASTM B 88, Specification for Seamless Copper Water Tube.
   17. ASTM B 251, Specification for General Requirements for Wrought Seamless Copper and Copper-Alloy Tube.
   18. ASTM B 302, Specification for Threadless Copper Pipe, Standard Sizes.
   19. ASTM D 638, Test Method for Tensile Properties of Plastics.
   20. ASTM D 696, Standard Test Method for Coefficient of Linear Thermal Expansion of Plastics between - 30°C and 30°C with a Vitreous Silica Dilatometer.

21. ASTM D 746, Test Method for Brittleness Temperature of Plastics and Elastomers by Impact.
22. ASTM D 790, Test Methods for Flexural Properties of Unreinforced and Reinforced Plastics and Electrical Insulating Materials.
23. ASTM D 1238, Test Method for Melt Flow Rates of Thermoplastics by Extrusion Plastometer.
24. ASTM D 1248, Specification for Polyethylene Plastics Extrusion Materials for Wire and Cable.
25. ASTM D 1330, Specification for Rubber-Sheet Gaskets.
26. ASTM D 1505, Test Method for Density of Plastics by the Density-Gradient Technique.
27. ASTM D 1525, Test Method for Vicat Softening Temperature of Plastics.
28. ASTM D 1598, Test Method for Time-to-Failure of Plastic Pipe under Constant Internal Pressure.
29. ASTM D 1603, Test Method for Carbon Black in Olefin Plastics.
30. ASTM D 1693, Test Method for Environmental Stress-Cracking of Ethylene Plastics.
31. ASTM D 2240, Test Method for Rubber Property-Durometer Hardness.
32. ASTM D 2774, Practice for Underground Installation of Thermoplastic Pressure Piping.
33. ASTM D 3261, Specification for Butt Heat Fusion Polyethylene (PE) Plastic Fittings for Polyethylene (PE) Plastic Pipe and Tubing.
34. ASTM D 3350, Specification for Polyethylene Plastics Pipe and Fittings Materials.
35. ASTM F 1248, Test Method for Determination of Environmental Stress Crack Resistance (ESCR) of Polyethylene Pipe.
36. AWWA C511, Reduced-Pressure Principle Backflow Prevention Assembly.
37. AWWA C701, Cold-Water Meters – Turbine Type, for Customer Service.
38. AWWA C703, Cold-Water Meters – Fire-Service Type.
39. AWWA C901, Polyethylene (PE) Pressure Pipe and Tubing, 1/2-inch through 3-inch, for Water Service.
40. FS O-F-506, Flux, Soldering: Paste and Liquid.
41. FS WW-U-516, Unions, Brass or Bronze, Threaded Pipe Connections and Solder-Joint Tube Connections.
42. NSF/ANSI 14, Plastics Piping Components and Related Materials.
43. NSF/ANSI 61, Drinking Water System Components – Health Effects.
44. South Carolina Department of Health and Environmental Control (SCDHEC), Notice of Approved Backflow Prevention Assemblies.
45. SCDHEC, State Primary Drinking Water Regulation 61-58.

1.3 QUALITY ASSURANCE

A. Installer's Qualifications:
   1. Engage a single installer regularly engaged in domestic water piping installation and with experience in the installation of the types of materials required; and who agrees to employ only tradesmen with specific skill and experience in this type of Work. Submit name and qualifications to ENGINEER.
   2. Engage a single installer for the entire domestic water piping system with undivided responsibility for performance and other requirements.

B. Regulatory Requirements: Comply with applicable provisions and recommendations of the following, except as otherwise shown or specified.
   1. National Electrical Code, (NEC).
   2. South Carolina Department of Health and Environmental Control (SCDHEC).

C. Component Supply and Compatibility:
   1. Obtain all equipment included in this Section regardless of the component manufacturer from a single domestic water piping systems manufacturer.
   2. The domestic water piping systems manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.
   3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the domestic water piping systems manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Product Data:
      a. Manufacturer's literature, illustrations, specifications and engineering data.
      b. Flexible connections.
      c. Other technical data related to the specified material and equipment as requested by ENGINEER.
      d. Gasket material.

B. Informational Submittals: Submit the following:
   1. Qualifications Statements:
      a. Installer’s qualifications.

C. Project Closeout Submittals: Submit the following:
   1. Record Documentation:
      a. During progress of the Work keep an up-to-date set of the Drawings showing field and Shop Drawing modifications.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping Handling and Unloading:
   1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices, which are to be embedded in cast-in-place concrete, in ample time to prevent delay of the Work.

B. Storage and Protection:
   1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
   2. Store all equipment in covered storage off the ground and prevent condensation and in accordance with the manufacturer’s recommendations for long-term storage.

C. Acceptance at Site:
   1. All boxes, crates and packages shall be inspected by CONTRACTOR upon delivery to the Site. CONTRACTOR shall notify ENGINEER, in writing, if any loss or damage exists to equipment or components. Replace lost equipment or components and repair damage to new condition, in accordance with manufacturer’s instructions.

PART 2 PRODUCTS

2.1 MATERIALS

A. Copper Water Tube:
   1. Tube:
      a. Reference: ANSI H23.1, ASTM B 88.
      b. Type: K or L.
      c. Temper: Hard-drawn or soft-annealed.
   2. Fittings:
      a. Soldered, reference: ANSI B16.18 for cast copper alloy or ANSI B16.22 for wrought copper and copper alloy.
      b. Soldered, drainage, reference: ANSI B16.23 for cast copper alloy or ANSI B16.29 for wrought copper and copper alloy.
      c. Flared, reference: ANSI B16.26.
      d. Threaded, reference: ANSI B16.15.
   3. Joints:
      a. Sweat:
         1) Solder Metal: ASTM B 32, Type 95-5TA.
         2) Flux: FS O-F-506, Type 1.
   4. Unions:
      a. Reference: FS WW-U-516.
      b. Material: Bronze.
      c. Rating: 250 lb. W.O.G.

B. High-Density Polyethylene (HDPE) Piping:
   1. HDPE piping system shall be specifically designed, constructed and installed for the potable water service.
   2. Physical Properties:
      a. Materials used for the manufacture of polyethylene pipe and fittings shall meet the following physical property requirements:

Property	Unit	Test Procedure	Value
Material Designation	-	PPI/ASTM	-
PPI Material Listing	-	PPI TR-4	PE 3408
Material Classification	-	ASTM D 1248	III C 5 P34
Cell Classification	-	ASTM D 3350	345434C or 355434C
Density	g/cm3	ASTM D 1505	>0.941
Melt Index (E)	g/10 min	ASTM D 1238	<0.15
Flexural Modulus	psi	ASTM D 790	>110,000
Tensile Strength	psi	ASTM D 638	<160,000
ESCR (C)	hours	ASTM D 1693	3,000 to 3,500
HDB	psi	ASTM D 2837	1,600 @ 23°C
UV Stabilizer (C)	percent carbon black	ASTM D 1603	2 to 3
Elastic Modulus	psi	ASTM D 638	110,000
Brittleness Temperature F		ASTM D 746	<-180
Vicat Softening Temp F		ASTM D 1525	255
Thermal Expansion in/in/ F		ASTM D 696	8 x 10E-5
Hardness	Shore D	ASTM D 2240	64
Molecular Weight Category	-	-	Extra-High

b. There shall be no evidence of splitting, cracking or breaking when the pipe is tested in accordance with Article 2.1.B.4, below.
c. Ring Stiffness Constant (RSC) values for the pipe can be directly related to the pipe's class designation. (Nominal RSC of Class 40 pipe = 40, etc.). The minimum RSC is 90 percent of the nominal.
d. The HDPE pipe and fittings shall be homogeneous throughout and free from visible cracks, holes, foreign inclusions or other injurious defects. The pipe shall be as uniform as commercially practical in color, opacity, density and other physical properties.
e. Clean rework or recycled material generated by the manufacturer's own production may be used as long as the pipe or fittings produced meet all the requirements of this Section.

3. Pipe and Fittings:
   a. Dimensions:
      1) Pipe Dimensions: The nominal inside diameter of the pipe shall be true to the specified pipe size in accordance with AWWA C901. Standard laying lengths shall be 50 feet ± 2-inches.

2) Fitting Dimensions: Fittings such as couplings, wyes, tees, adapters, etc. for use in laying pipe shall have standard dimensions that conform to ASTM D 3261.

b. Pipe and fittings shall be produced from identical materials, meeting the requirements of this Section, by the same manufacturer. Special or custom fittings may be exempted from this requirement.

c. Pipe and fittings shall be pressure rated to meet the service pressure requirements specified by ENGINEER. Whether molded or fabricated, fittings shall be fully pressure rated to at least the same service pressure rating as the pipe to which joining is intended.

d. Molded fittings shall meet the requirements of ASTM D 3261 and this Section. At the point of fusion, the outside diameter and minimum wall thickness of fitting butt fusion outlets shall meet the diameter and wall thickness specifications of the mating system pipe. Fitting markings shall include a production code from which the location and date of manufacture can be determined. The manufacturer shall provide an explanation of the production codes used.

e. Reducing tees with branch diameters of 16-inches or less shall be saddle tees.

f. Marking:

1) Each standard and random length of pipe and fitting in compliance with this standard shall be clearly marked with the following information.

a) ASTM or AWWA Standard Designation.
b) Pipe Size.
c) Class and Profile Number.
d) Production Code.
e) Standard Dimension Ratio (SDR).

4. Source Quality Control:

a. At a minimum, incoming polyethylene materials shall be inspected for density in accordance with ASTM D 1505 and melt flow rate in accordance with ASTM D 1238. All incoming polyethylene materials shall be certified by the supplier. Certification shall be verified by CONTRACTOR and ENGINEER. Incoming materials shall be approved by Manufacturer's Quality Assurance Program before processing into finished goods.

b. Representative samples of polyethylene materials shall be tested against the physical property requirements required herein. Each extrusion line and molding machine shall be qualified to produce pressure rated products by taking representative production samples and performing sustained pressure tests in accordance with ASTM D 1598.

c. Quality Assurance test for representative pipe and fitting samples shall include:

Test	Standard	Pipe	Fittings
Ring ESCR	ASTM F 1248	Yes	Not Applicable
Sustained pressure at 176°F/725 psi hoop stress (fo>100 h):	ASTM D 1598	Yes	Yes
Sustained pressure at 73°F/1,600 psi hoop stress (fo>1000 h):	ASTM D 1598	Yes	Yes

C. Dielectric Couplings:
    a. Refer to Section 33 05 06, Couplings, Adapters and Specials.

2.2 VALVES

A. Bronze Body Check Valves:
    1. Manufacturers: Provide products of one of the following:
        a. Ford Meter Box Company, Inc.
        b. Stockham Valves and Fittings Company.
        c. Lunkenheimer Company.
        d. Or equal.
    2. Type: Swing, regrinding bronze disc, screw-in cap.
    3. Materials: Brass and bronze.
    4. Rating: 150 lb. SWP.
    5. End Connections: Solder joint.

B. Bronze Body Ball Valves:
    1. Manufacturers: Provide products of one of the following:
        a. Stockham Valves and Fittings Company.
        b. Lunkenheimer Company.
        c. Or equal.
    2. Type: Non-blowout stem, adjustable packing gland, quarter turn, full port ball valve.
    3. Materials:
        a. Body: Cast bronze.
        b. Ball: Chrome plated brass.
        c. Packing and Seats: Teflon.
    4. Rating: 150 lb. SWP.
    5. End Connections: Screwed. Provide screwed to sweat adapters, where required.

C. Iron Body Gate Valves:
    1. Products and Manufacturers: Provide one of the following:
        a. Stockham Valves and Fittings, Fig. No. G-623.
        b. Lunkenheimer Company, Fig. No. 1430.
        c. American Cast Iron Pipe Company, Series 2500.
        d. M&H Valve Company, C509, C515.
        e. Mueller Company, LLC, 2360 Series.
        f. Or equal.
    2. Type: Rising stem, outside screw and yoke, solid wedge.
    3. Materials: Iron with bronze trim.
    4. Rating: 125 lb. SWP.
    5. End Connections: Threaded.

2.3 EQUIPMENT

A. Post Hydrants:
    1. Exposed Hose Connection, Non-Freeze Type:
        a. Manufacturers: Provide products of one of the following:
            1) Zurn Industries.

2) Or equal.
b. Type: Anti-siphon.
c. Materials:
1) Casing: Bronze.
2) Vacuum Breaker: Integral.
3) Threads: Two-inch hose thread outlet.
4) Wall Clamp: Adjustable with set screw.
5) Key: Removable tee handle type.
d. Connection: Two-inch sweat end inlet and 2-inch hose thread outlet, universal type.
e. Drain: 1/8-inch NPT drain hole.
f. Post Height to Hose Connection: 36-inches above finished ground elevation.

B. Backflow Preventers: 3/4-Inch to 2-Inches: Reduced Pressure Principle (RPP):
1. Products and Manufacturers: Provide from the most recent edition of SCDHEC List of Approved Backflow Prevention Devices, Reduced Pressure Principle Assemblies.
2. Type: Reduced pressure zone device with two independently acting check valves, together with an automatically operated pressure differential relief valve located between the two check valves.
3. Materials:
a. Body: Bronze.
b. Valve Discs: BUNA-N rubber.
c. Diaphragm: Silicone rubber or Buna-N rubber.
d. Springs: Stainless steel.
e. Screws: Stainless steel.
4. Maximum Working Pressure: 150 psi.
5. End Connections: Threaded.
6. Accessories:
a. Strainer with blow-off on inlet.
b. Ball valves on inlet and outlet.
c. Reduced pressure principle backflow preventer test kit for each unit furnished, provided in molded plastic carrying case with foam inserts.
7. References: ASSE 1013, AWWA C511 and authority having jurisdiction at the Site.

C. Backflow Preventers: 3-Inches and Larger: RPP:
1. Products and Manufacturers: Provide from the most recent edition of SCDHEC List of Approved Backflow Prevention Devices, Reduced Pressure Principle Assemblies.
2. Type: Reduced pressure zone device with two independently acting check valves, together with an automatically operated pressure differential relief valve located between the two check valves.
3. Materials:
a. Body: Bronze or cast-iron.
b. Valve Discs: Buna-N rubber.
c. Diaphragm: Silicon rubber or Buna-N rubber.
4. Maximum Working Pressure: 175 psi.
5. End Connections: Threaded or flanged.
6. Accessories:
a. Strainer with blow-off on inlet.
b. Outside screw and yoke gate valves on inlet and outlet.

c. Reduced pressure principle backflow preventer test kit for each unit furnished with carrying case, provided in molded plastic carrying case with foam inserts.

7. References: ASSE 1013, AWWA C511 and authority having jurisdiction at the Site

D. Backflow Preventers: DCV:
1. Products and Manufacturers: Provide from the most recent edition of SCDHEC List of Approved Backflow Prevention Devices, Double Check Valve Assemblies.
2. Type: Assembly of two single independently acting check valves with tight closing shut off valves at each end and suitable connections for testing the water tightness of each check valve.
3. Materials:
   a. Body: Bronze.
   b. Valve Discs: Silicon rubber.
   c. Springs: Stainless steel.
   d. Poppets: Glass-filled Celcon.
   e. Replaceable Seats: Glass-filled Noryl.
   f. Fasteners: Stainless steel.
   g. Test cocks: Bronze, four required.
4. Maximum Working Pressure: 150 psi.
5. End Connections: Threaded or Flanged.
6. Accessories:
   a. Ball valves or gate valves as shown on the drawings, on inlet and outlet with UL listed, FM approved tamper switches.
   b. DCV backflow preventer test kit provided in molded plastic carrying case with foam inserts for each unit furnished to be turned over to the OWNER.
      1) Products and Manufacturers: Provide one of the following:
         a) CMB Industries, Inc., Febco Division, Double Check Valve Backflow Prevention Assembly Differential Pressure Test Kit with carrying case.
         b) Watts Regulator, Backflow Preventer Test Kit with carrying case.
         c) Or equal.
7. Reference: Underwriters Laboratory listed, Factory Mutual approved.
8. Fire protection system backflow preventers shall be provided with a bypass assembly consisting of a water meter, approved double check valve backflow prevention assembly with shut-off valves and test cocks.

E. Water Meters for 3/4 - to 2-inch Water Services:
1. Type: Magnetic drive, disk water meter.
2. Products and Manufacturers: Provide one of the following:
   a. Mueller Systems LLC, MVR series.
   b. Neptune Technology Group Inc, T-10.
   c. Or equal.
3. Materials:
   a. Body: Bronze.
   b. Register: Brass.
4. Maximum Working Pressure: 150 psi.
5. End Connections: Threaded.
6. Meters shall conform to AWWA C701.

F. Water Meters for 3- and 4-inch Water Services:
1. Type: Magnetic drive, disk water meter.

a. Products and Manufacturers: Provide one of the following:
   1) Mueller Systems LLC, MVR series.
   2) Or equal.
b. Materials:
   1) Body: Bronze.
   2) Register: Brass.
c. Maximum Working Pressure: 150 psi.
d. End Connections: Flanged.
e. Meters shall conform to AWWA C701.

G. Water Meters for Fire-Services:
   1. Products and Manufacturers: Provide one of the following:
      a. Mueller Systems LLC, Model FM3.
      b. Or equal.
   2. Type: Magnetic drive, disk water meter.
   3. Materials:
      a. Body: Ductile iron or bronze.
   4. Size: 3-, 4-, 6-, 8- and 10-inch.
   5. Maximum Working Pressure: 175 psi.
   6. End Connections: Flanged.
   7. Meters shall conform to AWWA C703.

2.4 PIPE MARKING

A. Mark or label all materials with the following:
   1. Metal or alloy designation.
   2. Temper.
   3. Size and schedule.
   4. ASTM reference standard number.
   5. Name and location of supplier.

2.5 PAINTING

A. Piping and accessories shall be painted in accordance with manufacturer's recommendations.

PART 3 EXECUTION

3.1 INSTALLATION

A. General:
   1. Install all items as shown, specified, and as recommended by the manufacturers.
   2. Request instructions from ENGINEER, in writing, when there is a conflict between the manufacturer's recommendations and the Contract Documents.
   3. Present conflicts between piping systems and/or equipment and/or structures to ENGINEER, in writing, who will determine corrective measures to be taken.
   4. Do not modify structures to facilitate installation of piping, unless specifically approved by ENGINEER.

5. Installation shall conform to requirements of all local and state codes.
6. Properly plug or cap the open ends of all piping at the end of each day's Work or other stopping point through construction. Equipment shall be tightly covered and protected against dirt, water, and chemical or mechanical damage.
7. Refer to Section 33 05 05, Buried Piping Installation.

B. HDPE Piping:
   1. Heat Fusion of Pipe:
      a. HDPE pipe and fittings joints shall be heat fused by a qualified technician; trained by the manufacturer's representative in accordance with the manufacturer's recommended fusion procedures. Training must have occurred within the previous 12 months, or submittals verifying experience within the previous 12 months for all technicians performing heat fusion on polyethylene pipe and fittings.
      b. Weld in accordance with manufacturer's recommendation for butt fusion methods. Personnel operating fusion equipment shall be certified by the HDPE pipe manufacturer.
      c. The first butt fusion weld of each day's production welding and for each separate operator shall be tested by bent strap test method. No production welds shall be performed until successful completion of bent strap test.
      d. Butt fusion equipment for joining procedures shall be capable of meeting conditions recommended by HDPE pipe manufacturer including, but not limited to, temperature requirements, alignment, and fusion pressures. The equipment used for the heat fusion joints shall be capable of recording the heating and fusion pressures used to join the HDPE pipe, recording heater temperature, and storing this information for future retrieval (data logger). Each field fusion shall be recorded by such equipment and this information shall be made compiled into daily log reports. Log reports shall be submitted to CONTRACTOR and ENGINEER daily. Reports shall also include the results of the bent strap tests.
      e. For cleaning pipe ends, solutions such as detergents and solvents, when required, shall be used in accordance with manufacturer's recommendations.
      f. Do not bend pipe to greater degree than minimum radius recommended by manufacturer for type and grade. Shop Drawings shall address locations and deflections of required fittings to prevent installation that exceeds a greater degree of bending than the manufacturer's recommended minimum bending radius for each size and class of HDPE pipe.
      g. Do not subject pipe to strains that will overstress or buckle piping or impose excessive stress on joints.
      h. Branch saddle fusions shall be joined in accordance with manufacturer's recommendations and procedures. Branch saddle fusion equipment shall be of size to facilitate saddle fusion within trench.
      i. Before butt fusing pipe, inspect each length for presence of dirt, sand, mud, shavings, and other debris or animals. Remove debris from pipe.
      j. Cover open ends of fused pipe at the end of each day's Work. Cap to prevent entry by animals or debris.
   2. Flange Jointing:
      a. Use on flanged pipe connection sections.
      b. Connect slip-on Type 316 stainless steel backup flanges with Type 316 stainless steel nuts and bolts.
      c. Butt fuse fabricated flange adapters to pipe.
      d. Observe following precautions in connection of flange joints.

1) Align flanges or flange/valve connections to provide tight seal. Require nitrile-butadiene gaskets if needed to achieve seal. Integral flange adapters and gaskets are required for flange/valve connections.
2) Place U.S. Standard round washers as may be required on some flanges in accordance with manufacturer's recommendations. Bolts shall be lubricated in accordance with manufacturer's recommendations.
3) Tighten flange bolts in sequence and accordance with manufacturer's recommendations. CAUTION: Do not over-torque bolts.

e. Pull bolt down by degrees to uniform torque in accordance with manufacturer's recommendation.
f. Install electrofusion couplers, where used, in accordance with manufacturer's specifications.

3. Pipe Placement:
a. Grade control equipment shall be of type to accurately maintain design grades and slopes during installation of pipe.
b. Dewatering: Remove standing water in trench before pipe installation.
c. Unless otherwise specifically stated, install pipe in accordance with manufacturer's recommendations.
d. Maximum lengths of fused pipe to be handled as one section shall be placed according to manufacturer's recommendations as to pipe size, pipe SDR, and topography so as not to cause excessive gouging or surface abrasion, but shall not exceed 400 feet.
e. Cap pipe sections longer than single joining (usually 50 feet) on both ends during placement, except during fusing operations.
f. Notify ENGINEER prior to installing pipe into trench and allow time for ENGINEER'S inspection.
1) Correct irregularities found during inspection.
g. Complete tie-ins within trench whenever possible to prevent overstressed connections.
h. Allow pipe sufficient time to adjust to trench temperature prior to testing, segment tie-ins or backfilling activity.
i. Pipe shall be snaked in trench to allow a minimum of 12-inches/100 feet for thermal contraction and expansion.
j. Allow extra length at future connection points to be cut to fit after backfill and prior to tie-in.

3.2 REDUCED PRESSURE ZONE BACKFLOW PREVENTION

A. Provide RPZ-BFP devices or air gap separation for high hazard cross connections, as defined by SCDHEC 61-58.7.

3.3 FIELD QUALITY CONTROL

A. Field Tests:
1. Fill all systems and fully test all equipment, valves, etc. in operation.
2. Check for excessive vibration while all systems are operating.
3. Installed systems and components shall not be released to OWNER, unless all systems have been tested by the CONTRACTOR and approved by the ENGINEER.
4. Refer to 33 05 05, Buried Piping Installation, for buried piping disinfection and testing.

B. Inspection:
   1. Examine areas to receive piping, valves and accessories for:
      a. Defects that adversely affect execution and quality of the Work.
      b. Deviations beyond allowable tolerances for piping, valves and accessories.
      c. Start the Work only when conditions are satisfactory.
   2. The ENGINEER reserves the right to reject or authorize replacement of piping and accessories found to defective.

3.4 ADJUSTING AND CLEANING

A. Adjusting:
   1. Adjust all controls for proper settings.
   2. While system is operable balance all equipment, valves, etc. to achieve design conditions.

B. Cleaning:
   1. Thoroughly clean all piping, fittings, valves, and accessories prior to installation.
   2. Remove all dirt, rust, dust, etc. from piping in preparation for painting.
   3. Remove and dispose of all debris and waste from the Site resulting from installation.

C. Refer to Section 33 05 05, Buried Piping Installation.

3.5 MATERIAL SCHEDULES

A. Piping:
   1. Use types of pipe and fittings as specified below, unless otherwise specified or shown.
   2. All potable water piping 2-1/2-inches and smaller run underground shall be soft-annealed copper Type “K” copper tubing.
   3. All underground water piping 3-inches and larger shall be cement-lined ductile iron pipe with mechanical joints.
   4. All valves for copper or brass piping shall be bronze bodied, unless otherwise specified.
   5. All valves for ductile iron piping shall be iron bodied, unless otherwise specified.
   6. Use “wrought copper” fittings for copper tubing.
   7. Use “butt welded” fittings for welded steel pipe connections.

END OF SECTION

SECTION 33 31 01

SEWER LATERALS AND APPURTENANCES

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install wastewater sewer laterals and appurtenances.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate the installation of items that must be installed with, or before the Work required under this Section.

C. Related Sections:
   1. Section 33 05 05, Buried Piping Installation.
   2. Section 33 05 06, Couplings, Adapters and Specials

1.2 REFERENCES

A. Standards which may be referenced in this Section are:
   1. AWWA M41, Ductile-Iron Pipe and Fittings.
   2. AWWA C104, Cement-Mortar Lining for Ductile-Iron Pipe and Fittings.
   3. AWWA C111, Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
   4. AWWA C151, Ductile-Iron Pipe, Centrifugally Cast.
   5. ASTM D2466, Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40.
   6. ASTM D2564, Standard Specification for Solvent Cements for Poly(Vinyl Chloride) (PVC) Plastic Piping Systems,
   7. ASTM D2665, Standard Specification for Poly(Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings.
   8. ASTM D2774, Practice for Underground Installation of Thermoplastic Pressure Piping.
   9. ASTM D3034, Standard Specification for Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings.
   10. ASTM D3212, Standard Specification for Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.
   11. ASTM F477, Standard Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe.
   12. ASTM F794, Standard Specification for Poly(Vinyl Chloride) (PVC) Profile Gravity Sewer Pipe and Fittings Based on Controlled Inside Diameter.
   13. ASTM F1417, Test Method for Installation Acceptance of Plastic Gravity Sewer Lines using Low-Pressure Air.
   14. ANSI/AWWA C600, Installation of Ductile-Iron Water Mains and Their Appurtenances.
   15. NSF/ANSI Standard 14, Plastics Piping System Components and Related Materials.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Manufacturer shall be able to provide evidence of at least five installations of substantially similar products in satisfactory operation for at least five years.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Product Data:
      a. Product data sheet.
      b. Complete catalog information, including dimensions, weight, specifications, and identification of materials of construction of parts.

B. Informational Submittals: Submit the following:
   1. Certifications: Submit a certificate signed by the manufacturer of each product stating that the product complies with the applicable referenced standards.

1.5 DELIVERY, STORAGE AND HANDING

A. Packing, Shipping, Handling and Unloading:
   1. Deliver materials to the Site to ensure uninterrupted progress of the Work.

B. Storage and Protection:
   1. Protect materials from corrosion and deterioration.
   2. Store equipment in covered storage off the ground and prevent condensation and in accordance with the manufacturer's recommendations for long-term storage.

PART 2 PRODUCTS

2.1 GENERAL

A. Sewer Laterals: Provide one of the following as conditions warrant:
   1. Less than 16-feet cover, SDR 35 with minimum ring stiffness of 46psi, or Schedule 40 PVC pipe conforming to ASTM D2665, NSF 14 and ASTM D2466.
      a. Fittings shall be socket type in accordance with ASTM D2466.
      b. Joining shall be through solvent cement in accordance with ASTM D2564.
   2. 16-feet of cover or greater, Ductile Iron pipe of pressure class 350 conforming to AWWA C151.
      a. Pipe interior shall have a cement-mortar lining of standard thickness according to AWWA C104.
      b. Pipe exterior shall have a bituminous coat a minimum of 1-millimeter thick.
      c. Joining shall be by rubber gaskets and in conformance with AWWA C111.
   3. Joints, PVC pipe joints shall be solvent cemented in accordance with ASTM D2855.

B. Sewer Lateral Wye Branches:
   1. Sewer lateral wye branches shall be the same type material as the sewer main, and shall conform to the applicable sewer pipe specifications.

C. Sewer Lateral Cleanouts: Provide cleanouts of same material as the lateral.

D. Sewer Lateral Cap: Provide HS-20 traffic-rated plugs.

E. Couplings: See Section 33 05 06, Couplings, Adapters and Specials.

F. Saddles:
   1. Provide saddles of ABS plastic, PVC, elastomeric PVC or approved equivalent.
   2. Connect saddles to vitrified clay pipe using epoxy sealant.
   3. Connect saddles to PVC pipe using a flat or profile gasket, as appropriate to the pipe, and minimum two stainless steel bands around the pipe and saddle.
   4. Connect the lateral to the saddle with a compression gasket, solvent weld adapter, and/or stainless steel band, as appropriate.

G. Sewer Cut-ins:
   1. Provide cast iron cut-ins where new sewer laterals are connected to existing sewer mains smaller than 36-inch (GENCO, Model D, Type K, DFW flexible saddle, pre-approved equivalent).
   2. For sewer cut-ins on 36-inch and larger sewer mains a Kor-N-Tee, Inserta-Tee or pre-approved equivalent shall be used.

PART 3 EXECUTION

3.1 INSTALLATION

A. 4-Inch and 6-Inch Laterals
   1. Connect laterals to the main with tees or wyes if the lateral is installed during construction with the main.
   2. Connect to existing mains with saddles placed in holes cored by an approved coring machine.
   3. Install laterals to the property line using 45-degree bends at the tee or saddle and pipe as shown in the Drawings.
   4. Install laterals that will discharge at terminal ends of the sewer main at 2% slope. Install all other laterals with a minimum slope of 1/8-inch per foot (1%).
   5. Cap the end of the lateral to be water/air tight.
   6. Encase all tees, saddles and bends shall be completely in #67 washed stone.
   7. Cut an “S” in the curb at the location where lateral crosses under curb.
   8. In subdivisions constructed without curb, paint a green “S” on the edge of pavement at the location where the lateral crosses under the edge of pavement.
   9. Connect to the sewer main all laterals except those serving lots adjacent to in line manholes or upstream from dead-end manholes in cul-de-sacs.
   10. Laterals connected to manholes shall be laid on a line from the center of the lot to the center of the manhole and shall extend not more than three inches inside the manhole wall.
   11. Manholes in cul-de-sacs shall have a maximum of 3 laterals. Any in line manhole shall have a maximum of 4 laterals.
   12. The lateral elevation entering the manhole shall match crown to crown with the main entering the manhole and a trough shall be formed for the lateral invert.
   13. Laterals that are connected to outfall lines shall enter the manhole at the shelf and an invert shall be formed to carry the lateral flow to the main invert.

14. Install laterals with a minimum of 4-feet of cover at the property line, unless otherwise approved by York County Water/Sewer Department. Install laterals with a maximum of 5-feet unless greater depth of the lateral installation is approved by a York County Inspector.

B. 8-Inch and Larger Laterals
   1. Connect 8-inch and larger diameter laterals to manholes with the lateral crown level with the crown of the main line pipe, or with outside drops, in accordance with the Drawings.
   2. When the lateral is the same diameter as the main line pipe, provide a drop of 0.2 feet in the manhole between the invert of the lateral and the invert of the main line pipe.
   3. Provide a minimum slope of 1/8-inch per foot (1%).

C. Install sewer laterals to be perpendicular to the mainline when possible.

D. Cleanouts shall be installed at the roadway right-of-way or easement line.

E. Install all sewer laterals and appurtenances in accordance with Section 33 05 05, Buried Piping Installation.

END OF SECTION

SECTION 40 05 05

EXPOSED PIPING INSTALLATION

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment and incidentals as shown, specified, and required to install and test all exposed piping, fittings, and specials. The Work includes the following:
      a. All types and sizes of exposed piping, except where exposed piping installations are specified under other Sections.
      b. Unless otherwise shown or specified, this Section includes all piping beginning at the outside face of structures or structure foundations and extending into the structure. Piping embedded in concrete within a structure or foundation shall be considered as exposed and is included herein. Piping that is permanently or intermittently submerged, or installed in sub-aqueous environments, is considered as exposed and is included in this Section.
      c. Work on or affecting existing exposed piping.
      d. Installation of all jointing and gasket materials, specials, flexible couplings, mechanical couplings, harnessed and flanged adapters, sleeves, tie rods, and all Work required for a complete exposed piping installation.
      e. Supports, restraints, and other anchors.
      f. Field quality control, including testing.
      g. Cleaning.
      h. Incorporation of valves, meters, and special items shown or specified into the piping systems per the Contract Documents and as required

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items that must be installed with or before exposed piping Work.
   2. Coordinate with appropriate piping Sections of Division 40.

C. Related Sections:
   1. Section 40 05 07, Pipe Hangers and Supports.
   2. Section 40 05 08, Wall Pipes, Floor Pipes and Pipe Sleeves.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ASME Boiler and Pressure Vessel Code.
   2. ASME B31.3, Process Piping.
   3. American Society for Non-Destructive Testing (ASNT), ASNT-TC-1A, Recommended Practice, Personnel Qualification, and Certification in Non-destructive Testing.
   4. ASTM A380, Standard Practice for Cleaning, Descaling, and Passivation of Stainless Steel Parts, Equipment, and Systems.
   5. ASTM B32, Specification for Solder Metal.
   6. ASTM D4174, Standard Practice for Cleaning, Flushing, and Purification of Petroleum Fluid Hydraulic Systems.
   7. ANSI/AWWA C111, Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.

8. ANSI/AWWA C600, Installation of Ductile Iron Water Mains and Their Appurtenances.
9. AWWA M41, Ductile-Iron Pipe and Fittings.

1.3 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Comply with requirements and recommendations of authorities having jurisdiction over the Work, including:
      a. York County.
      b. South Carolina Department of Transportation.
      c. South Carolina Department of Health and Environmental Control.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Detailed drawings in plan and, as applicable, section.
      b. Details of piping, valves, supports, accessories, specials, joints, harnessing, and main anchor supports, and connections to existing piping, structures, equipment, and appurtenances.
      c. Laying schedules for piping with restrained joints.
   2. Testing Plans, Procedures, and Testing Limitations:
      a. Submit description of proposed testing methods, procedures, and apparatus, and obtain ENGINEER's approval prior to testing.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Submit a certificate, signed by manufacturer of each product, certifying that product complies with applicable referenced standards.
   2. Source Quality Control Submittals:
      a. Submit copies of testing report for each test.
   3. Site Quality Control Reports:
      a. Submit copies of testing report for each test.

C. Closeout Submittals: Submit the following:
   1. Record Documentation:
      a. Maintain accurate and up-to-date record documents showing field and Shop Drawing modifications. Record documents for exposed piping Work shall show actual location of all piping and appurtenances on a copy of the Drawings, unless otherwise approved by ENGINEER.
      b. Record documents shall show piping with elevations referenced to the project datum and dimensions from permanent structures. For straight runs of pipe provide offset dimensions as required to document pipe location.
      c. Include section drawings with exposed piping record documents when the Contract Documents include section Drawings.
      d. Conform to Section 01 78 39, Project Record Documents.

1.5 DELIVERY, STORAGE AND HANDLING

A. Delivery:
   1. Deliver products to Site to ensure uninterrupted progress of the Work.

2. Upon delivery, inspect pipe and appurtenances for cracked, gouged, chipped, dented, and other damage and immediately remove damaged products from Site.
3. Conform to requirements of Section 01 65 00, Product Delivery Requirements.

B. Storage:
1. Store products for convenient access for inspection and identification. Store products off the ground using pallets, platforms, or other supports. Protect packaged products from corrosion and deterioration.
2. Pipe and fittings materials may be stored outdoors without cover.
3. Conform to requirements of Section 01 66 00, Product Storage and Handling Requirements.

C. Handling:
1. Handle pipe, fittings, specials, and accessories carefully with approved handling devices. Do not drop or roll material of delivery vehicles. Do not otherwise drop, roll, or skid piping.
2. Avoid unnecessary handling of pipe.
3. Keep pipe interiors free of dirt and foreign matter.
4. Protect interior linings and exterior coatings of pipe and fittings from damage. Replace pipe and fittings with damaged lining regardless of cause of damage. Repair damaged coatings.
5. Conform to requirements of Section 01 65 00, Product Delivery Requirements.

PART 2 PRODUCTS

2.1 MATERIALS

A. Piping materials are specified in the Exposed Piping Schedule at the end of this Section. Piping materials shall conform to Specification for each type of pipe and piping appurtenances in applicable sections of Division 40, Process Integration.

B. Markings and Identification:
1. Pipe Markings:
a. Clearly mark each piece of pipe or fitting with a designation conforming to that shown on the approved Shop Drawings.
b. Manufacturer shall cast or paint on each length of pipe and each fitting the pipe material, diameter, and pressure or thickness class.
2. Pipe Identification Markers and Arrows: Refer to Section 40 05 19, Ductile Iron Process Pipe.

C. Appurtenances: Provide products that comply with:
1. Section 40 05 07, Pipe Hangers and Supports.
2. Section 40 05 08, Wall Pipes, Floor Pipes and Pipe Sleeves.

PART 3 EXECUTION

3.1 INSPECTION

A. Examine conditions under which the Work is to be installed and notify ENGINEER in writing of conditions detrimental to the proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General:
   1. Install piping as shown, specified and as recommended by the pipe and fittings manufacturer.
   2. If there is a conflict between manufacturer's recommendations and the Contract Documents, request in writing instructions from ENGINEER before proceeding.
   3. Provide pipe manufacturer's installation specialist at Site as specified on this Section.

B. Temporary Blind Flanges, Plugs, Caps, and Bulkheads:
   1. Temporarily plug installed pipe at the end of each day of work or other interruption of pipe installation to prevent entry of animals, liquids, and persons into pipe, and entrance or insertion of deleterious materials into pipe.
   2. Install standard plugs in all bells at dead ends, tees, and crosses. Cap all spigot and plain ends.
   3. Fully secure and block blind flanges, plugs, caps, and bulkheads installed for testing, designed to withstand specified test pressure.
   4. Where plugging is required for phasing of Work or subsequent connection of piping, install watertight, permanent type blind flanges, plugs, caps, or bulkhead acceptable to ENGINEER.

C. Piping Installation:
   1. Conform to manufacturer's instructions and requirements of standards and manuals listed in this Section, as applicable:
      a. Ductile Iron Pipe: ANSI/AWWA C600, AWWA M41.
   2. Install straight runs true to line and elevation.
   3. Install vertical pipe truly plumb in all directions.
   4. Install piping parallel or perpendicular to walls of structures. Piping at angles and 45 degree runs across corners of structures will not be accepted unless specifically shown on the Contract Documents or approved by the ENGINEER.
   5. Install small diameter piping generally as shown when specific locations and elevations are not indicated. Locate such piping as required to avoid ducts, equipment, beams, and other obstructions.
   6. Install piping to leave all corridors, walkways, work areas, and similar spaces unobstructed. Unless otherwise approved by ENGINEER provide a minimum headroom clearance under piping and pipe supports of 7.5 feet. Clearances beneath piping shall be measured from the outermost edge of piping, flanges or other type of joint that extends beyond the nominal outside diameter of piping.
   7. Cutting: Cut pipe from measurements verified at Site. Field cut pipe, where required, with a machine specially designed for cutting type of pipe being installed. Make cuts carefully without damage to pipe, coating, or lining, and with a smooth end at right angles to axis of pipe. Cut ends of push-on joint type pipe shall be tapered and sharp edges filed off smooth. Do not flame-cut pipe.

D. Jointing Pipe:
   1. General:

a. Make joints in accordance with pipe manufacturer's recommendations and Contract Documents.
b. Cut piping accurately and squarely and install without forcing or springing.
c. Ream out pipes and tubing to full inside diameter after cutting. Remove all sharp edges on end cuts.
d. Remove all cuttings and foreign matter from inside of pipe and tubing before installation. Thoroughly clean all pipe, fittings, valves, specials, and accessories before installing.

2. Ductile Iron Flanged Joints:
   a. Assemble flanged joints using ring-type gaskets, with thickness as recommended by pipe manufacturer but not less than 1/8-inch thick, for raised-face flanges. Use full-face gaskets for flat-face flanges, unless otherwise approved by ENGINEER or recommended by pipe manufacturer. Gaskets shall be suitable for the service intended in accordance with the manufacturer's ratings and instructions. Gaskets shall be properly centered.
   b. Tighten bolts in a sequence that provides equal distribution of bolt loads.
   c. Length of bolts shall be uniform. Bolts shall not project beyond the nut more than 1/4-inch or fall short of the nut when fully taken up. Machine-cut ends of bolts to be neatly rounded. Do not use washers.
   d. Prior to assembly of flanged joints, lubricate bolt threads and gasket faces.
   e. Alternately tighten bolts 180 degrees apart to compress the gasket evenly.
   f. After assembly, coat all bolts and nuts, except stainless steel bolts and nuts, with coating appropriate for pipe and fittings being joined, as recommended by manufacturer.
3. Copper Tubing Joints:
   a. Soldered Joints:
      1) Assemble copper tubing with soldered joints. Solder shall be 95-5 tin-antimony solder conforming to ASTM B32.
      2) Ream or file pipe to remove burrs.
      3) Clean and polish contact surfaces of joints.
      4) Apply flux to both male and female ends.
      5) Insert end of tube into full depth of fitting socket.
      6) Heat joint evenly.
      7) Form continuous solder bead around entire circumference of joint starting at the bottom.
   b. Threaded Joints:
      1) When open flames for soldering are impractical, or at unions and connections to equipment and appurtenances, assemble copper tubing with flared ends as permitted by authority having jurisdiction.
      2) Ends of tubing shall be flared at an angle of 45 degrees with flaring tool recommended by pipe manufacturer. Flaring tool shall have same outside diameter as tube to be flared.
      3) Tubing to be flared shall be soft temper or annealed prior to flaring.
      4) Cut end of tube square and ream to remove burrs.
      5) Resize back to round tube that is out-of-round.
      6) Clean and polish contact surfaces of joints using an abrasive cloth.
      7) Place flare nut over end of tube with threads closest to end being flared.
      8) Insert appropriate length of tube between flaring bar of flaring tool and position yolk with flaring cone over tube end and clamp yoke in place.
      9) Turn handle of yolk clockwise without over-tightening. Cracked or deformed tubes will be rejected.

10) Do not apply jointing compounds to mating surfaces of flare fitting and flared tube end before attaching flare nut to threaded connection.

4. Mechanical Coupling Joints:
   a. Mechanical couplings include sleeve-type flexible couplings, split flexible couplings, and other mechanical couplings used.
   b. Prior to installing and assembling mechanical couplings, thoroughly clean joint ends with a wire brush to remove foreign matter.
   c. For mechanical couplings that incorporate gaskets, after cleaning apply lubricant to rubber gasket or inside of coupling housing and to joint ends. After lubrication, install gasket around joint end of previously installed piece and mate joint end of subsequent piece to installed piece. Position gasket and place coupling housing around gasket. Insert bolts and install nuts tightly by hand. Tighten bolts uniformly to produce an equal pressure on all parts of housing. When housing clamps meet metal to metal, joint is complete and further tightening is not required.

E. Installing Valves and Accessories:
   1. Provide supports for large valves, flow meters, and other heavy items as shown or required to prevent strain on adjoining piping.
   2. Position flow measuring devices in pipe lines so that they have the amount of straight upstream and downstream runs recommended by the flow measuring device manufacturer, unless specific location dimensions are shown.
   3. Position swing check valves and butterfly valves so that they do not conflict with upstream and downstream elements of the piping system.

F. Unions:
   1. Install dielectric unions as specified in Section 33 05 06, Couplings, Adapters, and Specials**,** where dissimilar metals are connected, except for bronze or brass valves in ferrous piping.
   2. Provide a union downstream of each valve with screwed connections.
   3. Provide screwed or flanged unions at each piece of equipment, where shown, and where necessary to install or dismantle piping.

G. Transitions from One Type of Pipe to Another:
   1. Provide all necessary adapters, specials, and connection pieces required when connecting different types and sizes of pipe or connecting pipe made by different manufacturers.

H. Closures:
   1. Provide closure pieces, such as blind flanges and caps, shown or required to complete the Work.

3.3 THRUST RESTRAINT

A. Provide thrust restraint on all pressure piping systems and where otherwise shown or specified.

B. Thrust restraints shall be designed for axial thrust exerted by test pressure specified in the Exposed Piping Schedule at end of this Section.

3.4 WORK AFFECTING EXISTING PIPING

A. Location of Existing Piping:
   1. Locations of existing piping shown on Drawings is approximate.

2. Determine the true location of existing piping to which connections are to be made, crossed, and that could be disturbed, and determine location of other facilities that could be affected by the Work.

B. Taking Existing Pipelines Out of Service:
   1. Conform to Section 01 14 16, Coordination with Owner's Operations.

C. Work on Existing Pipelines:
   1. Cut or tap pipes as shown or required with machines and tools specifically designed for cutting or tapping pipelines.
   2. Install temporary plugs to prevent entry of mud, dirt, water, and debris into pipe.
   3. Provide necessary adapters, sleeves, fittings, pipe, and appurtenances required to complete the Work.
   4. Conform to applicable requirements of Section 01 14 16, Coordination with Owner's Operations.

3.5 PAINTING

A. Surface preparation, priming, finish painting, and touch-up painting shall conform to the manufacturer's paint standards.

3.6 FIELD QUALITY CONTROL

A. Testing, General:
   1. Test all piping, except as exempted in the Exposed Piping Schedule.
   2. Notification:
      a. Notify ENGINEER at least 48 hours prior to testing.
      b. When authorities having jurisdiction are to witness tests, notify ENGINEER and authorities having jurisdiction in writing at least 48 hours in advance of testing.
   3. Conduct all tests in presence of ENGINEER.
   4. Remove or protect pipeline-mounted devices that could be damaged by testing.
   5. Provide all apparatus and services required for testing, including:
      a. Test pumps, compressors, hoses, calibrated gages, meters, test containers, valves, fittings, and temporary pumping systems required to maintain OWNER's operations.
      b. Temporary bulkheads, bracing, blocking, and thrust restraints.
   6. Provide air if an air test is required, power if pumping is required, and gases if gases are required.
   7. Unless otherwise specified, OWNER will provide fluid required for hydrostatic testing. CONTRACTOR shall provide means to convey fluid for hydrostatic testing into the pipe being tested. CONTRACTOR shall provide fluid for other types of testing required.
   8. Repair observed leaks and repair pipe that fails to meet acceptance criteria. Retest after repair.
   9. Unless otherwise specified, testing shall include existing piping systems that connect with new piping system. Test existing pipe to nearest valve. Piping not installed by CONTRACTOR and that fails the test shall be repaired upon authorization of ENGINEER or OWNER. Repair of existing piping will be paid as extra work unless otherwise specified.

B. Test Schedule:
   1. Refer to the Exposed Piping Schedule for type of test required and required test pressure.
   2. Unless otherwise specified, the required test pressures are at lowest elevation of pipeline segment being tested.

3. For piping not listed in Exposed Piping Schedule:
    a. Hydrostatically test pipe that will convey liquid at a pressure greater than five psig.
4. Test Pressure:
    a. Use test pressures listed in Exposed Piping Schedule.
    b. If test pressure is not listed in Exposed Piping Schedule, or if a test is required for piping not listed in the Exposed Piping Schedule, test pressure will be determined by the ENGINEER based on the maximum anticipated sustained operating pressure and the methods described in the applicable ANSI/AWWA manual or standard that applies to the piping system.

C. Hydrostatic Testing:
1. Preparation for Testing:
    a. Follow procedures described in AWWA Manual M9. A wetting period is not required for pipe that is not cement mortar-lined.
    b. Prior to testing, ensure that adequate thrust protection is in place and all joints are properly installed.
    c. Piping for Hydraulic Fluid, Lube Oil, and Diesel Fuel: Hydrostatically test system using the fluid with which system will function permanently. Allowable leakage is zero. For fluid power systems, manufacturer shall supervise installation and testing of system components, including field piping.
2. Test Procedure:
    a. Fill pipeline slowly to minimize air entrapment and surge pressures. Fill rate shall not exceed one foot of pipe length per second in the pipe being tested.
    b. Expel air from pipe as required. Obtain approval of ENGINEER prior to tapping pipe for expelling air.
    c. Examine joints and valves, and make repairs to eliminate visible leakage.
    d. After specified wetting period, add fluid as required to pressurize line to required test pressure. Maintain test pressure for a stabilization period of ten minutes before beginning test.
    e. Timed test period shall not begin until after the pipe has been filled, exposed to the required wetting period, air has been expelled, and pressure stabilized.
    f. Timed Test Period: After the stabilization period, maintain test pressure for at least two hours. During timed testing period, add fluid as required to maintain pressure within five psig of required test pressure. The test pressure shall then remain steady for one hour, indicating no leakage.
    g. Pump from a test container to maintain test pressure. Measure volume of fluid pumped from test container and record on test report. Record pressure at test pump at fifteen minute intervals for duration of test.
3. Allowable Leakage Rates: Leakage is defined as the quantity of fluid supplied to pipe segment being tested to maintain pressure within five psi of the test pressure during timed test period. Allowable leakage rates for piping are:
    a. No Leakage: Pipe with flanged, threaded, soldered, or brazed joints.
    b. Rates based on formula or table in AWWA Manual M41:
        1) Metal and fiberglass pipe joined with rubber gaskets as sealing members, including the following joint types:
            a) Bolted sleeve type couplings.

D. Process Air Pipe Testing:
1. General:
    a. Required test pressure is listed in Exposed Piping Schedule.
2. Preparation for Testing:

a. Provide temporary tie rods at expansion joints as required.
b. Verify that pipe supports, where present, are secure.
c. Test one pipe segment at a time. Use temporary blind flanges and isolators as required.
d. Install corporation cocks for filling and relieving air. Provide temporary automatic pressure relief valve and pressure gauge with range suitable for test pressure.

3. Test Procedure:
   a. Pressurize pipe segment being tested with air to the required test pressure. Maintain pressure for at least two hours.
   b. Apply a soapy water solution to all joints to check for leakage, indicated by presence of bubbles, while test pressure is maintained.
   c. Allowable Leakage: Zero
4. Repair and retest pipelines that fail the test.
5. After testing is complete remove temporary measures provided for testing and provide Type 304 stainless steel threaded plugs at taps used for testing.

3.7 CLEANING

A. Cleaning, General: Clean pipe systems as follows:
   1. Thoroughly clean all piping, including flushing with water, dry air, or inert gas as required, in a manner approved by ENGINEER, prior to placing in service.
   2. Piping 24-inch diameter and larger shall be inspected from inside and debris, dirt and foreign matter removed.

B. Cleaning of Hydraulic and Fluid Power Oil Systems: Upon completion of field piping, but before connection to control components, hydraulic and fluid power oil systems shall be flushed and cleaned by circulating special flushing oil through the system. Flushing oil and procedures shall comply with ASTM D4174. System shall be cleaned such that internal contamination of system, when tested using procedures specified in SAE J1227, Section 2.3, shall not exceed the Allowable Cleanliness Level (ACL). Unless otherwise specified, ACL value shall be established by manufacturer of major hydraulic system components in accordance with SAE J1227, Section 9.1.

3.8 EXPOSED PIPING SCHEDULE

A. The schedules listed below, following the “End of Section” designation, are a part of this Specification section.
   1. Table 40 05 05-A, Exposed Piping Schedule.

END OF SECTION

TABLE
40 05 05-A, EXPOSED PIPING SCHEDULE

Service	Diameter (inch)	Material	Interior Lining	Exterior Coating	Pressure Class/ Thickness	Joint	Test	Remarks

The following abbreviations are used in the Exposed Piping Schedule.

A. Service Abbreviations

Service	Abbrev.		Service	Abbrev.
Sanitary Force Main	SFM		Fuel Oil	FO
Wastewater	WW			

B. Material Abbreviations

Material	Abbrev		Material	Abbrev.
Ductile Iron	DI			
Copper	C			

C. Lining/Coating Abbreviations

Lining	Abbrev		Coating	Abbrev.
Cement Mortar Lined	CL		Painted	P
Ceramic Epoxy	CE			

D. Joint Abbreviations

Joint Type	Abbrev		Joint Type	Abbrev.
Soldered	Sd		Flanged	Flg
Brazed	Bz		Flanged Adapter	FA

E. Test Abbreviations

Test	Abbrev		Test	Abbrev.
Hydrostatic Test (test pressure in psig)	HYD ( )		Exfiltration Test	EX

SECTION 40 05 07

PIPE HANGERS AND SUPPORTS

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified and required to design, furnish, and install all hangers, supports and appurtenances necessary to complete the Work.

B. Coordination:
   1. Review installation procedures under other Sections and coordinate the installation of items that must be installed with the pipe hangers and supports Work.

C. Related Sections:
   1. Section 03 00 05, Concrete.
   2. Section 05 50 13, Miscellaneous Metal Fabrications.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American Society for Testing and Materials, (ASTM).
      a. ASTM A 575, Specification for Steel Bars Carbon, Merchant Quality, M-Grades.
      b. ASTM E 84, Test Method for Surface Burning Characteristics of Building Materials.
   2. Federal Specification, (FS).
      a. S A-A-1192, Hangers, Pipe.
   3. Manufacturers Standardization Society of the Valve and Fittings Industry, (MSS).
      a. MSS SP 58, Pipe Hangers and Supports-Materials, Design and Manufacture.
      b. MSS SP 69, Pipe Hangers and Supports - Selection and Application.
   4. Underwriters' Laboratories, Inc., (UL).
      a. UL 203, Pipe Hanger Equipment for Fire Protection Service.

1.3 QUALITY ASSURANCE

A. Each type of pipe hanger or support shall be the product of one manufacturer.

B. Component Supply and Compatibility:
   1. Obtain all equipment included in this Section regardless of the component manufacturer from a single pipe hangers and supports manufacturer.
   2. The pipe hangers and supports equipment manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.
   3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the pipe hangers and supports equipment manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Detailed drawings showing all hangers and supports for each piping system specified. Shop Drawings shall show location, installation, material, loads or forces, and deflection of all hangers and supports.
      b. Each pipe system shall be analyzed for all loads and forces on the hangers and supports. Provide calculations of reaction forces to the structure to which they are fastened. Provide confirmation that hanger systems comply with support requirements and codes.
      c. Submit and coordinate these with Shop Drawings required for all piping systems.
   2. Product Data:
      a. Submit manufacturers' catalogs, literature, and engineering data on all hangers and supports. Load ratings, materials and installation shall be consistent with the recommendations of the MSS SP 58, MSS SP 69 and Federal Specification A-A-1192.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling and Unloading:
   1. Deliver materials to the Site to ensure uninterrupted progress of the Work. Deliver anchor bolts and anchorage devices which are to be embedded in cast-in-place concrete in ample time to prevent delay of that Work.

B. Storage and Protection:
   1. Store materials to permit easy access for inspection and identification. Keep all material off the ground, using pallets, platforms, or other supports. Protect steel members and packaged materials from corrosion and deterioration.
   2. Store materials in covered storage off the ground and prevent condensation.

C. Acceptance at Site:
   1. All boxes, crates and packages shall be inspected by CONTRACTOR upon delivery to the Site. CONTRACTOR shall notify ENGINEER, in writing, if any loss or damage exists to equipment or components. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

PART 2 PRODUCTS

2.1 GENERAL

A. Hangers and supports shall meet with the following requirements:
   1. Standard and fabricated hangers and supports shall be furnished complete with necessary inserts, bolts, nuts, rods, washers, and other accessories.
   2. Generally, run piping in groups where practicable and parallel to building wall. Provide minimum clearance of 1-inch between pipe and other work.
   3. Install hangers or supports at all locations where pipe changes direction.
   4. All hangers and supports shall be capable of adjustment after placement of piping.

5. Different types of hangers or supports shall be kept to a minimum.
6. All suspended or supported ductile iron pipe shall have a hanger or support adjacent to each hub.
7. Support vertical piping at each floor and between floors by stays or braces to prevent rattling and vibration.
8. Hanger rods shall be straight and vertical. Chain, wire, strap or perforated bar hangers shall not be used. Hangers shall not be suspended from piping.
9. Maximum support spacing unless otherwise shown or approved for standard weight ductile iron pipe shall be as follows:
    a. Exposed pressure pipe shall not span longer than 12-feet without appropriate support.
    b. Exposed soil pipe shall not span longer than 10-feet without appropriate support.
    c. Pipe shall not have pockets formed in the span due to sagging of the pipe between supports caused by the weight of the pipe, medium in the pipe, insulation, valves and fittings.
    d. Pipe hanger and support selection shall be as shown and in this Section.
10. Where proper hanger or support spacing does not correspond with joist or rib spacing, structural steel channels may be attached to joists or ribs and pipes suspended there from.
11. Supports and hangers shall be of a material that is compatible with the fluid being conveyed in such pipe being supported.
12. Anchors for pipe support systems shall be compatible or protected by a coating system which is compatible with the fluid being conveyed in such pipe being supported.

B. Expansion compensation shall be designed for individual exposed piping systems with the following Design Criteria:
1. $\Delta L = L \times \Delta T \times \alpha$
    a. Where ΔL = pipe length change (inches).
    b. L = pipe length between anchors (inches).
    c. ΔT = 100 (F).
    d. α = coefficient of thermal expansion (inches/inches/F).
2. Expansion compensation shall be designed as an integral part of the piping hanger, support and anchorage system.
3. Expansion compensation shall be achieved via expansion joints.

2.2 HANGERS AND SUPPORTS

A. Hangers and supports where shown shall be in accordance with detail drawings. Hangers and supports not shown shall be in accordance with MSS SP 58.

B. Products and Manufacturers: Provide products from one of the following:
1. Anvil International, Inc.
2. Elcen Metal Products Co.
3. Cooper Industries, B-Line.
4. Unistrut Corporation.
5. Or equal.

2.3 ACCESSORIES

A. Hanger rods shall be made from ASTM A 575, with square head nut on top and running thread on bottom end.

B. Concrete Inserts:
   1. Concrete inserts shall be MSS SP 58 malleable Type 18.
   2. Concrete inserts shall be of the continuous type capable of supporting the amount of force as shown on the Drawings.
   3. Manufacturers: Provide products of one of the following:
      a. Unistrut Corporation, Wayne, Michigan.
      b. Elcan Metal Products, Company, Franklin Park, Illinois.
      c. B-Line.
      d. Anvil International, Inc.
      e. Or equal.

C. Steel Beam Clamps:
   1. Steel beam clamps shall be of malleable iron and conform to MSS SP 58.

D. Inserts for Pipe Insulation:
   1. Insulated pipe, larger than 1-1/2-inches in diameter, shall be supported by a rigid insert to protect the insulation. A steel metal saddle of sufficient gauge to carry the weight of the pipe and its fluid without deforming shall extend 2-inches minimum on each side of the rigid insert. The joints between insert and insulation shall be sealed before saddle is installed. Sizes up to 6-inches IPS shall be MSS SP 58, Type 40, and for sizes over 10-inches shall be MSS SP 58, Type 39.

E. Brackets:
   1. Brackets for wall mounting shall conform to: MSS SP 58 Type 32 for medium welded steel bracket, Type 33 for heavy welded steel bracket and Type 34 for side beam support.

F. Fabricated Pipe Rack:
   1. Pipes shall be supported and anchored to the fabricated pipe rack as shown. Clamps, rollers, and supports for piping shall conform to the general requirements of MSS SP 69.

2.4 PAINTING

A. Clean and prime ferrous metal surfaces in the shop.

B. Field painting shall conform to manufacturer recommendations.

PART 3 EXECUTION

3.1 INSTALLATION

A. Locate hangers, supports, and accessories to support piping, valves, and at all concentrated loads.

B. Locate hangers, supports, and accessories within maximum span lengths specified to support continuous pipeline runs unaffected by concentrated loadings.

C. Locate hanger, supports to prevent vibration or swaying and to provide for expansion and contraction.
   1. Temperature differential specified in this Section.
   2. Support piping independently so that equipment is not stressed by piping weight or expansion.
   3. Uncoated Hangers, Rods and Supports: Dip in zinc chromate primer before installation.
   4. Hanger types for horizontal piping, except as noted and shown:
      a. Forged steel adjustable clevis type, rod support for all services.
      b. Slide Bases:
         1) Pipe stand, brackets, trapeze or other equivalent structural support.
         2) For piping 2-inches or larger.
      c. For pipe and covering provide:
         1) Saddles for rollers or slide bases.
         2) Protective shields or saddles for all other types of supports.
      d. Threaded Steel Rods:
         1) Two inch vertical adjustment with two nuts each end for positioning and locking.
         2) Size hanger rods according to the schedule below, unless otherwise noted:

Nominal Pipe (Inches)	Rod Diameter (Inches)
2 and less	3/8
2-1/2 to 3-1/2	1/2
4	5/8
6	3/4
8 through 12	7/8
14 through 18	1
20 through 30	1-1/4

         3) For Double Rod Hangers: One size smaller than above.
         4) Connection to Structure for Piping to 2-Inches: Concrete inserts, or expansion shields in shear into sides of beams.
         5) Connection to Structure for Piping 2-1/2-Inch or Larger: Concrete inserts, beam clamps or suitable bridging.
   5. Vertical Piping:
      a. Base Support: Base elbow or welded equivalent.
         1) Bearing plate on structural support.
      b. Guides not to exceed:
         1) 25 feet for piping to 2-inches.
         2) 36 feet for piping 2-1/2-inches or larger.
      c. Top Support:
         1) Special hanger or saddle in horizontal connection.
         2) Provisions for expansion.
      d. Intermediate Supports: Steel pipe clamp at floor.
         1) Bolted and welded to pipe.

2) Extension ends bearing on structural steel or bearing plates.

e. For Multiple Pipes: Coordinate guides, bearing plates and accessory steel.

D. Install items to be embedded before concrete placement.

E. Fasten embedded items securely to prevent movement during concrete placement.

F. Install hangers and support units on piping systems in accordance with manufacturer's recommendations.

G. Adjust hangers and supports and place grout for concrete supports to bring pipelines to specified elevations.

H. Bring all pipe systems up to operating pressures and temperatures. Cycle systems to duplicate operating conditions. Correct all support malfunctions.

END OF SECTION

SECTION 40 05 08

WALL PIPES, FLOOR PIPES, AND PIPE SLEEVES

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. CONTRACTOR shall provide all labor, materials, equipment and incidentals as shown, specified and required to furnish and install all floor pipes, pipe sleeves, wall pipes, other wall pieces, and escutcheons to complete the Work.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate with the installation of floor pipes, pipe sleeves, wall pipes, other wall pieces and escutcheons that must be installed with or within formwork, walls, partitions, ceilings and panels.

C. Related Sections:
   1. Section 03 00 05, Concrete.
   2. Section 07 92 00, Joint Sealants.
   3. Section 33 05 05, Buried Piping Installation.
   4. Section 40 05 05, Exposed Piping Installation.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American National Standards Institute, (ANSI).
      a. ANSI B16.1, Cast-Iron Pipe Flanges and Flanged Fittings.
      b. ANSI B16.4, Gray-Iron Threaded Fittings.
   2. American Water Works Association, (AWWA).
      a. AWWA C104 (ANSI A21.4), Cement-Mortar Lining for Ductile-Iron Pipe and Fittings for Water.
      b. AWWA C110 (ANSI A21.10), Ductile-Iron and Gray-Iron Fittings, for Water.
      c. AWWA C111 (ANSI A21.11), Rubber-Gasket Joints for Ductile-Iron Pressure Pipe and Fittings.
      d. AWWA C115 (ANSI A21.15), Flanged Ductile-Iron Pipe with Ductile-Iron or Gray-Iron Threaded Flanges.
      e. AWWA C151 (ANSI A21.51), Ductile-Iron Pipe, Centrifugally Cast, for Water.
      f. AWWA C200, Steel Water Pipe 6-Inches and Larger.

1.3 QUALITY ASSURANCE

A. Component Supply and Compatibility:
   1. Obtain all equipment included in this Section regardless of the component manufacturer from a single wall pipes, floor pipes and pipe sleeves manufacturer.
   2. The wall pipes, floor pipes and pipe sleeves manufacturer to review and approve or to prepare all Shop Drawings and other submittals for all components furnished under this Section.

3. All components shall be specifically constructed for the specified service conditions and shall be integrated into the overall assembly by the wall pipes, floor pipes and pipe sleeves manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Detailed drawings and data on all wall and floor pipe, and pipe sleeves. Submit and coordinate these with Shop Drawings required for all piping systems.

1.5 DELIVERY, STORAGE AND HANDLING

A. Comply with the requirements of Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.

PART 2 PRODUCTS

2.1 MATERIALS

A. Wall and Floor Pipes:
   1. Material: Same as specified for the piping connected to wall or floor pipe, unless otherwise approved by ENGINEER.
   2. End Connections: As shown.
   3. Thickness: Same as specified for the piping connected to wall or floor pipe.
   4. Collars: Provide collars at mid-point of wall for anchorage and watertightness.
   5. Pipes ends shall be flush with wall face, unless otherwise shown.
   6. Drill and tap flanged ends and mechanical joint bells for studs. Provide studs of same material as connected piping, except submerged and buried studs shall be of Type 316 stainless steel.

B. Pipe Sleeves:
   1. Ferrous and Plastic Pipe: Use standard weight stainless steel pipe, unless otherwise shown.
   2. Copper Pipe: Use Type K hard drawn copper pipe, unless otherwise shown.

C. Cast Wall Sleeves:
   1. Material: Ductile iron furnished with integral wall collar.
   2. Dimensions: As required for mechanical joint pipe to pass through sleeve. Length as required.

D. Link Seals: Provide link type mechanical seals suitable for 20 psi working pressure, corrosive service and accessible from one side, with glass-reinforced nylon pressure plate and stainless steel bolts and nuts.
   1. Products and Manufacturers: Provide one of the following:
      a. Link-Seal, as manufactured by Thunderline Corporation.
      b. Or equal.

PART 3 EXECUTION

3.1 INSTALLATION

A. Wall and Floor Pipes: Install as shown and in accordance with approved Shop Drawings.

B. Pipe Sleeves:
1. Use sleeves wherever pipes pass through walls, partitions, floors, and roofs, unless otherwise shown.
2. Extend all sleeves through floor slabs a minimum of 2-inches above finished floor.
3. Anchor sleeves to concrete and masonry walls as shown or otherwise approved.
4. All sleeves through walls shall be flush with wall face.
5. All pipe joints and annular spaces in exterior walls or walls subjected to hydrostatic pressure shall be completely watertight.
6. Use link type seals to seal sleeve against hydrostatic pressure. Size sleeves to provide annular space required to suit the link type mechanical seals that are used.
7. Do not install sleeves and pipes through structural members, unless specifically shown and approved by ENGINEER.
8. Size sleeves to provide annular space as follows:

Pipe Size	Sleeve ID Minus Pipe Or Insulation OD
Less than 2-inches	1/2-inches to 3/4-inches
2-inches to 4-inches	3/4 inches to 1-1/4-inches.
6-inches to 12-inches	1-1/4 inches to 2-inches
Over 12-inches	2-inches to 3-inches

END OF SECTION

SECTION 40 05 19

DUCTILE IRON PROCESS PIPE

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish ductile iron pipe and fittings.
   2. Extent of piping is shown on the Drawings. Piping schedules in Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation, specify pipe service, diameter, material, lining, coating, pressure rating, joint type, and testing required.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before ductile iron pipe Work.

C. Related Sections:
   1. Section 31 23 05, Excavation and Fill.
   2. Section 33 05 05, Buried Piping Installation.
   3. Section 40 05 05, Exposed Piping Installation.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ANSI B18.2.1, Square and Hex Bolts and Screws Inch Series.
   2. ANSI B18.2.2, Square and Hex Nuts. (Inch Series).
   3. ASTM A193, Alloy Steel and Stainless Steel Bolting Materials for High-Temperature Service.
   4. ASTM A194, Specification for Carbon Steel and Alloy Steel Nuts for Bolts for High-Pressure or High-Temperature Service, or Both.
   5. ASTM A307, Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength.
   6. ASTM A354, Specification for Quenched and Tempered Alloy Steel Bolts, Studs and Other Externally Threaded Fasteners.
   7. ASTM A563, Specification for Carbon and Alloy Steel Nuts.
   8. ASTM B117, Practice for Operating Salt Spray (Fog) Apparatus.
   9. ASTM C283, Test Methods for Resistance of Porcelain Enameled Utensils to Boiling Acid.
   10. ASTM D714, Test Method for Evaluating Degree of Blistering of Paints.
   11. ASTM D792, Test Methods for Density and Specific Gravity (Relative Density) of Plastics by Displacement.
   12. ASTM D5162, Discontinuity (Holiday) Testing of Non-Conductive Protective Coating on Metallic Substrates.
   13. ASTM E96, Test Methods for Water Vapor Transmission of Materials.
   14. ASTM G14, Test Method for Impact Resistance of Pipeline Coatings (Falling Weight Test).
   15. ASTM G62, Test Methods for Holiday Detection in Pipeline Coatings.
   16. ASTM G95, Test Methods for Cathodic Disbondment Test of Pipeline Coatings (Attached Cell Method).
   17. ANSI/AWWA C104, Cement-Mortar Lining for Ductile Iron Pipe and Fittings for Water.
   18. ANSI/AWWA C110, Ductile Iron and Gray Iron Fittings for Water.

19. ANSI/AWWA C111, Rubber-Gasket Joints for Ductile Iron Pressure Pipe and Fittings.
20. ANSI/AWWA C115, Flanged Ductile Iron Pipe with Ductile Iron or Gray Iron Threaded Flanges.
21. ANSI/AWWA C151, Ductile Iron Pipe, Centrifugally Cast, for Water.
22. ANSI/AWWA C153, Ductile Iron Compact Fittings, 3 inch through 24 inch and 54 inch through 64 inch for Water Service.
23. ANSI/AWWA C606, Grooved and Shouldered Type Joints.

25. MSS-SP 60, Connecting Flange Joint Between Tapping Sleeves and Tapping Valves.
26. NACE RP0188, Discontinuity (Holiday) Testing of New Protective Coatings on Conductive Substrates.
27. NAPF 500-03, Surface Preparation Standard for Ductile Iron Pipe and Fittings Receiving Special External Coatings and/or Special Internal Linings.
28. NSF/ANSI 61, Drinking Water System Components - Health Effects.
29. SSPC PA 2, Measurement of Dry Coating Thickness with Magnetic Gages.
30. SSPC Painting Manual, Volume 1, Para. XIV.
31. SCDHEC, State Primary Drinking Water Regulation 61-58.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer:
      a. Manufacturer shall have a minimum of five years successful experience producing ductile iron pipe and fittings and shall be able to show evidence of at least five installations in satisfactory operation in the United States that are similar applications to the specified service.
      b. Lining and coating products shall be manufactured by a firm with a minimum of five years successful experience in protecting pipelines exposed to the specified service conditions, and shall be able to show evidence of at least five installations in satisfactory operation in the United States that are similar applications to the specified service.
      c. When not applied by the manufacturer, lining and coating Subcontractor shall have a minimum of five years successful experience in the application of the specified linings and coatings for similar applications for the specified service, and shall be able to show evidence of at least five installations in satisfactory operation in the United States.

B. Supply and Compatibility:
   1. Unless otherwise approved, obtain all pipe, fittings, and appurtenances included in this Section from a single ductile iron pipe manufacturer.
   2. Ductile iron pipe manufacturer shall review and approve or prepare all Shop Drawings and other submittals for pipe, fittings, and appurtenances furnished under this Section.
   3. Pipe, fittings, and appurtenances shall be suitable for the specified service and shall be integrated into overall piping system by ductile iron pipe manufacturer.
   4. Ductile iron pipe manufacturer shall be responsible for all products and all factory-applied linings and coatings, whether installed at pipe manufacturer's facility or at manufacturer's Supplier's facility.

C. Regulatory Requirements:

1. Pipe and fittings, including linings and coatings, that will convey potable water or water that will be treated to become potable, shall be certified by an accredited organization in accordance with NSF/ANSI 61 as being suitable for contact with potable water, and shall comply with requirements of authorities having jurisdiction at Site.

1.4 SUBMITTALS

A. Action Submittals: Submit the following with Shop Drawings required under Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation:
   1. Shop Drawings:
      a. Detailed drawings and data for pipe, fittings, gaskets, appurtenances, linings, and coatings.
   2. Samples:
      a. Submit Sample of pipe and fitting with each type of lining, for use at the Site to verify continuity, surface gloss, and color, as applicable, via visual inspection.
   3. Test Procedures: For linings and coatings in pipe and fittings.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Submit certificate signed by manufacturer of each product that product conforms to applicable referenced standards and the Contract Documents.
   2. Source Quality Control Submittals:
      a. Submit results of specified shop tests for pipe, fittings, linings, and coatings.
      b. Lining and coating test coupons.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Refer to Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.

B. Handling of Pipe and Fittings Lined with Ceramic Epoxy: Lifting devices shall not come into contact with lined surfaces. Use hooks, forks, chains, straps, and other lifting devices only on exterior of pipe and fittings. Pipe and fittings with damaged lining shall be replaced regardless of cause of damage.

PART 2 PRODUCTS

2.1 MATERIALS

A. General:
   1. Piping systems shall be suitable for their intended use.
   2. Joints shall be as specified in Section 33 05 05, Buried Piping Installation and Section 40 05 05, Exposed Piping Installation. If not specified, provide flanged joints for exposed piping and push-on or mechanical joints for buried piping. Provide couplings on pipe with plain or grooved ends where shown or where approved by ENGINEER.

B. Ductile Iron Pipe, Joints, and Fittings:
   1. Flanged Pipe: Fabricate in accordance with ANSI/AWWA C115.
      a. Pressure Rating: As specified in piping schedule in Section 40 05 05, Exposed Piping Installation. If not otherwise specified, use Special Thickness Class 53 for three-inch

to 54-inch diameter pipe and Pressure Class 350 for 60-inch and 64-inch diameter pipe.

2. Non-Flanged Pipe: Conform to ANSI/AWWA C151 for material, pressure, dimensions, tolerances, tests, markings, and other requirements.
   a. Pressure Class: As specified in piping schedules in Section 33 05 05, Buried Piping Installation and Section 40 05 05, Exposed Piping Installation. If not otherwise specified, use Pressure Class 350 for 12-inch and smaller diameter pipe and Pressure Class 250 for 16-inch and larger diameter pipe .
   b. Special Thickness Class: As specified in piping schedules in Section 33 05 05, Buried Piping Installation and Section 40 05 05, Exposed Piping Installation.
3. Pipe Joints:
   a. Flanged Joints: Conform to ANSI/AWWA C110 and ANSI/AWWA C111 capable of meeting the pressure rating or special thickness class, and test pressure specified in piping schedule in Section 40 05 05, Exposed Piping Installation.
      1) Gaskets: Unless otherwise specified, gaskets shall be at least 1/8-inch thick, ring or full-face as required for the pipe, of synthetic rubber compound containing not less than 50 percent by volume nitrile or neoprene, and shall be free from factice, reclaimed rubber, and other deleterious substances. Gaskets shall be suitable for the service conditions specified, specifically designed for use with ductile iron pipe and fittings.
      2) Bolts: Comply with ANSI B18.2.1.
         a) Exposed: ASTM A307, Grade B.
         b) Buried or Submerged: ASTM A193, Grade B8M, Class 2, Heavy hex, Type 316 stainless steel.
      3) Nuts: Comply with ANSI B18.2.2.
         a) Exposed: ASTM A563, Grade A, Heavy hex.
         b) Buried or Submerged: ASTM A194, Grade B8M, Heavy hex, Type 316 stainless steel.
   b. Mechanical Joints: Comply with ANSI/AWWA C111 and ANSI/AWWA C151, capable of meeting pressure rating or special thickness class, and test pressure specified in piping schedules in Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.
      1) Glands: Ductile iron.
      2) Gaskets: Plain tip.
      3) Bolts and Nuts: High strength, low alloy steel.
      4) Manufacturers: Provide products of one of the following:
         a) Clow Water Systems Company.
         b) Atlantic States Cast Iron Pipe Company.
         c) Canada Pipe Company, Ltd.
         d) McWane Cast Iron Pipe Company.
         e) Pacific States Cast Iron Pipe Company.
         f) Griffin Pipe Products Co.
         g) American Cast Iron Pipe Co.
         h) U.S. Pipe and Foundry Co.
         i) Or equal.
   c. Push-On Joints: Comply with ANSI/AWWA C111 and ANSI/AWWA C151, capable of meeting pressure class or special thickness class, and test pressure specified in piping schedules in Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.
      1) Gaskets: Vulcanized SBR, unless otherwise specified.

2) Stripes: Each plain end shall be painted with a circular stripe to provide a guide for visual check that joint is properly assembled.
3) Products and Manufacturers: Provide one of the following:
    a) Tyton or Fastite Joint by Clow Water Systems, Atlantic States Cast Iron Pipe Company, Canada Pipe Company, Ltd., McWane Cast Iron Pipe Company, Pacific States Cast Iron Pipe Company, and Griffin Pipe Products Company.
    b) Fastite Joint by American Cast Iron Pipe Company.
    c) Tyton Joint by U.S. Pipe and Foundry Company.
    d) Or equal.

d. Grooved End Joints: Comply with ANSI/AWWA C606.
1) Gaskets: Flush seal type designed for ductile iron that complies with or exceeds requirements of ASTM D2000
2) Bolts and nuts: As specified for flanged joints.
3) Unless otherwise specified, grooved end couplings shall be rigid joint for exposed service and flexible joint for buried service.
4) Products and Manufacturers: Provide one of the following:
    a) Victaulic, Style 31.
    b) Or equal.

e. Restrained Joints: Restrained push-on joints shall be capable of being deflected after full assembly. Field cuts of restrained pipe are not allowed without approval of ENGINEER.
1) Products and Manufacturers: Provide restrained joints for mechanical joint piping by one of the following:
    a) Megalug, Series 1100, by EBBA Iron Sales, Inc.
    b) MJ Coupled Joint, by American Cast Iron Pipe Co.
    c) MJ Field Lok, by U.S. Pipe and Foundry Co.
    d) Or equal.
2) Products and Manufacturers: Provide restrained joints for push-on joint piping by one of the following:
    a) Lok-Ring Joint, or Flex-Ring Joint, by American Cast Iron Pipe Co.
    b) TR Flex Joint, by U.S. Pipe and Foundry Co.
    c) Or equal.

4. Flanged and Push-On Joint Fittings: Comply with ANSI/AWWA C110 and ANSI/AWWA C111. For compact fittings, comply with ANSI/AWWA C153.
    a. Material: Ductile iron.
    b. Pressure rating, gaskets, bolts, and nuts shall be as specified for flanged joints. Pressure rating of fittings shall meet, but not exceed, specified pressure rating or special thickness class of the connected pipe. All fittings, including glands and bolts, shall be manufactured in domestic foundries.
5. Mechanical Joint Fittings: Comply with ANSI/AWWA C110 and ANSI/AWWA C111. For compact fittings, comply with ANSI/AWWA C153.
    a. Material: Ductile iron.
    b. Glands: Ductile iron.
    c. Pressure rating, gaskets, bolts, and nuts shall be as specified for mechanical joints. Pressure rating of fittings shall meet, but not exceed, specified pressure rating or special thickness class of connected pipe.
    d. Mechanical Joint Bolt Holes: Orient bolt holes to straddle vertical centerline of fittings as shown on the Drawings.
    e. All fittings, including glands and bolts, shall be manufactured in domestic foundries.

C. Lining, General:
   1. Typical Service Conditions:

Property	Buried Water	Buried Sanitary	Force Mains
Fluid(s) Conveyed Through Pipe	Potable Water	Sanitary Waste Water	Sanitary Waste Water
Lining Type	Cement Mortar	Cement Mortar	Ceramic Epoxy

   2. Surface Preparation:
      a. Surface Preparation: Prepare surface in accordance with recommended method.
      b. Finished Surface Inspection: Lining applicator shall inspect finished surface prior to application to determine acceptability. If surface is unacceptable, repeat surface preparation as necessary.

D. Cement-mortar Lining:
   1. Where specified in piping schedules included with Section 33 05 05, Buried Piping Installation and Section 40 05 05, Exposed Piping Installation, pipe and fittings shall be lined with bituminous seal coated cement-mortar lining in accordance with ANSI/AWWA C104.

E. Ceramic Quartz-Filled, Amine-Cured Novalac Epoxy Lining:
   1. Where specified in piping schedules included with Section 33 05 05, Buried Piping Installation and Section 40 05 05, Exposed Piping Installation, pipe and fittings shall be factory lined with a quartz-filled, amine-cured, novalac, epoxy containing at least twenty percent by volume of ceramic quartz pigment.
   2. Ceramic epoxy lining shall have a permeability rating of zero when tested according to Method A of ASTM E96, Procedure A, with a test duration of thirty days.
   3. Conduct the following tests on coupons from factory lined ductile iron pipe:
      a. ASTM B117 Salt Spray (scribed panel): Results to equal zero undercutting after two years.
      b. ASTM G95 Cathodic Disbondment 1.5 volts at 77 degrees F: Results to equal no more than 0.5 mm undercutting after thirty days.
      c. Immersion Testing rated using ASTM D714.
         1) Twenty Percent Sulfuric Acid: No effect after two years.
         2) Twenty-five Percent Sodium Hydroxide at 140 degrees F: No effect after two years.
         3) Distilled Water at 160 degrees F: No effect after two years.
         4) Tap Water at 120 degrees F (scribed panel): Zero undercutting after two years, with no effect.
   4. Ceramic epoxy lining shall have abrasion resistance of no more than four mils loss after one million cycles, in accordance with ES EN 598, Section 7.8, Abrasion Resistance.
   5. Within eight hours of surface preparation, interior of pipe and fittings shall receive 40 mils dry film thickness, utilizing method recommended by lining manufacturer that will comply with requirements of this Section. Number of coats applied shall be as recommended by lining manufacturer. Minimum substrate and ambient temperature for lining application shall be 40 degrees F.
   6. Inspection and Certification:
      a. Check all ductile iron pipe and fitting linings for thickness using magnetic film thickness gage in accordance with method in SSPC PA 2 Film Thickness Rating.

b. Test interior lining of pipe barrels and fittings for pinholes with non-destructive, 2,500-volt test. Defects found shall be repaired in accordance with lining manufacturer's recommendations prior to shipment from lining applicator's factory.
c. Mark each pipe and fitting with date of application and its numerical sequence of application.

7. Products and Manufacturers: Provide one of the following:
   a. Protecto 401 Ceramic Epoxy.
   b. Tnemec Perma-Shield 431.
   c. Or equal.

F. Couplings:
1. Refer to Section 33 05 06, Couplings, Adapters and Specials.

G. Specials:
1. Transition Pieces:
   a. Provide suitable transition pieces (adapters) for connecting to existing piping.
   b. Unless otherwise shown or indicated, expose existing piping to determine material, dimensions, and other data required for transition pieces.
2. Taps:
   a. Provide taps where shown or required for small-diameter piping or instrumentation connections.
   b. Provide corporation stops where shown or required.
   c. Allowable tap sizes are shown in Table 40 05 19-A. Provide tapping saddle with outlet joints conforming to requirements of this Section.

Table 40 05 19-A, Allowable Direct Tapping

Size (inch)	Pressure Class				
	150	200	250	300	350
	Maximum Allowed Direct Tap Size (inch)				
3	-	-	-	-	0.75
4	-	-	-	-	0.75
6	-	-	-	-	1
8	-	-	-	-	1
10	-	-	-	-	1
12	-	-	-	-	1.25
14	-	-	1.25	1.5	1.5
16	-	-	1.5	2	2
18	-	-	2	2	2
20	-	-	2	2	2
24	-	2	2	2	2

   d. For flanged connections on tapping saddle outlet branch, counterbore flange in accordance with MSS SP-60 dimensions. Inside diameter of outlet shall be 1/4-inch greater than nominal diameter.
3. Tangential Outlets:
   a. Provide tangential outlet fittings where shown or indicated.
   b. Weld-on fittings are acceptable.
   c. Flanged and grooved end joints are not allowed.

2.2 MARKING FOR IDENTIFICATION

A. In addition to identification markings specified in Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation, also stamp, mark, and identify push-on joint and mechanical joint pipe with:
   1. Name or trademark of manufacturer.
   2. Weight, class or nominal thickness, and casting period.
   3. Country where cast.
   4. Year the pipe was produced.
   5. Letters “DI” or “Ductile” shall be cast or metal stamped

B. In addition to identification markings specified in Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation, also stamp, mark, and identify flanged pipe with:
   1. Flange manufacturer’s mark, size, and letters “DI” cast or stamped on the flanges.
   2. Fabricator’s mark if other than flange manufacturer.
   3. Length and weight.

C. In addition to identification markings specified in Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation, also stamp, mark, and identify fittings with:
   1. Manufacturer’s identification.
   2. Pressure rating.
   3. Nominal diameters of openings.
   4. Country where cast.
   5. Number of degrees or fraction of the circle on bends.
   6. Letters “DI” or “Ductile” cast on them.

2.3 EXTERIOR SURFACE PREPARATION AND COATINGS

A. General Coating Requirements:
   1. Coating types are specified in piping schedules in Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.

B. Exposed Pipe and Fittings:
   1. Surface Preparation:
      a. Initial Surface Inspection: Pipe and fitting manufacturer and coating applicator shall inspect surface to be coated and mutually determine recommended NAPF 500-03 surface preparation method.
      b. Surface Preparation: Prepare surface in accordance with recommended NAPF 500-03 method.
      c. Finished Surface Inspection: Prepared surfaces shall be inspected by coating applicator prior to application to determine acceptability of finished surface. If surface is unacceptable, repeat surface preparation and re-application as necessary.
   2. After recommended surface preparation, prime coat exterior ferrous metal surfaces of pipe and fittings in the shop.

C. Buried Pipe and Fittings:
   1. Asphaltic Coating: Where specified in piping schedule in Section 33 05 05, Buried Piping Installation, coat pipe and fittings with an asphaltic coating approximately one-mil thick, in accordance with ANSI/AWWA C151, ANSI/AWWA C115, ANSI/AWWA C110, and ANSI/AWWA C153, as applicable.

PART 3 EXECUTION

3.1 INSPECTION

A. Inspect piping to assure that piping is free from defects in material and workmanship. Verify compatibility of pipe, fittings, gaskets, linings, and coatings.

3.2 INSTALLATION AND FIELD QUALITY CONTROL

A. For buried piping installation and testing, refer to Section 33 05 05, Buried Piping Installation.

B. For exposed piping installation and testing, refer to Section 40 05 05, Exposed Piping Installation.

END OF SECTION

SECTION 40 05 31

THERMOPLASTIC PROCESS PIPE

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install thermoplastic piping and fittings.
   2. Extent of piping is shown and shall be in accordance with piping schedules in Section 33 05 05, Buried Piping Installation.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items to be installed with or before thermoplastic piping Work.

C. Related Sections:
   1. Section 33 05 05, Buried Piping Installation.

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. AASHTO, Standard Specifications for Highway Bridges.
   2. ASTM D1784, Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds.
   3. ASTM D1785, Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80 and 120.
   4. ASTM D2464, Specification for Threaded Poly (Vinyl Chlorinated) (PVC) Plastic Pipe Fittings, Schedule 80.
   5. ASTM D2466, Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40.
   6. ASTM D2467, Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80.
   7. ASTM D2513, Specification for Thermoplastic Gas Pressure Pipe, Tubing, and Fittings.
   8. ASTM D2564, Specification for Solvent Cements for Poly (Vinyl Chloride) (PVC) Plastic Piping Systems.
   9. ASTM D2665, Specification for Poly (Vinyl Chloride) (PVC) Plastic Drain, Waste, and Vent Pipe and Fittings.
   10. ASTM D3034, Specification for Type PSM Poly (Vinyl Chloride) (PVC) Sewer Pipe and Fittings.
   11. ASTM D3139, Specification for Joints for Plastic Pressure Pipes Using Flexible Elastomeric Seals.
   12. ASTM D3212, Specification for Joints for Drain and Sewer Plastic Pipes Using Flexible Elastomeric Seals.
   13. ASTM D3222, Unmodified Poly (Vinylidene Fluoride) (PVDF) Molding Extrusion and Coating Materials.
   14. ASTM D3311, Specification for Drain, Waste and Vent (DWV) Plastic Fittings Patterns.
   15. ASTM D4101, Specification for Polypropylene Injection and Extrusion Materials.

16. ASTM F437, Specification for Threaded Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80.
17. ASTM F439, Specification for Chlorinated Poly (Vinyl Chloride) (CPVC) Plastic Pipe Fittings, Schedule 80.
18. ASTM F441, Specification for Chlorinated Poly(Vinyl Chloride) (CPVC) Plastic Pipe, Schedules 40 and 80.
19. ASTM F477, Specification for Elastomeric Seals (Gaskets) for Joining Plastic Pipe.
20. ASTM F656, Specification for Primers for Use in Solvent Cement Joints of Poly (Vinyl Chloride) (PVC) Plastic Pipe and Fittings.
21. ASTM F679, Specification for Poly (Vinyl Chloride) (PVC) Large-Diameter Plastic Gravity Sewer Pipe and Fittings.
22. ASTM F1336, Specification for Poly (Vinyl Chloride) (PVC) Gasketed Sewer Fittings.
23. ASTM F1674, Standard Test Method for Joint Restraint Products for Use with PVC Pipe.
24. ASTM F1760, Specification for Coextruded Poly (Vinyl Chloride) (PVC) Non-Pressure Plastic Pipe Having Reprocessed-Recycled Content.
25. AWWA C900, Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 4 In.-12 In. (100 mm-300 mm), for Water Transmission and Distribution
26. AWWA C905, Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 14 In.-48 In. (350 mm-1,200 mm).
27. AWWA C907, Injection-Molded Polyvinyl Chloride (PVC) Pressure Fittings, 4 In. Through 12 In. (100 mm Through 300 mm).
28. NSF 14, Plastic Piping Systems Components and Related Material.
29. ANSI/NSF 61, Drinking Water System Components - Health Effects.
30. Standards of U.S. Food and Drug Administration.
31. SCDHEC, State Primary Drinking Water Regulation 61-58.

1.3 QUALITY ASSURANCE

A. Qualifications:
   1. Manufacturer: Shall have a minimum of five years experience producing thermoplastic pipe and fittings substantively similar to the materials specified, and shall be able to submit documentation of satisfactory service in at least five completed installations in operation for at least five years each.
   2. Installer:
      a. Engage a single pipe installer who shall be responsible for all thermoplastic pipe Work, and who shall employ only tradesmen with specific skills and experience in the type of Work required.
      b. Installer shall have a minimum of five years experience installing thermoplastic pipe and fittings substantively similar to the materials specified and substantively similar to or larger than the scope of thermoplastic piping Work on the Project, and shall be able to submit documentation of satisfactory experience in at least five completed installations in operation for at least five years each.

B. Component Supply and Compatibility:
   1. Obtain all materials included in this Section, regardless of component Supplier, from a single thermoplastic pipe Supplier. All pipe of each material type shall be furnished by the same manufacturer.
   2. Thermoplastic pipe Supplier shall review and approve to prepare all Shop Drawings and other submittals for all materials furnished under this Section.
   3. Materials shall be suitable for specified service conditions and shall be integrated into overall assembly by thermoplastic pipe Supplier.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Submit piping layout Shop Drawings in accordance with Section 33 05 05, Buried Piping Installation.
   2. Product Data:
      a. Submit product data on pipe, fittings, gaskets, hardware, and appurtenances sufficient to demonstrate compliance with the Contract Documents.

B. Informational Submittals: Submit the following:
   1. Certificates:
      a. Submit manufacturer's certificate of compliance standards referenced in this Section.
   2. Source Quality Control Submittals:
      a. When requested by ENGINEER, submit results of source quality control tests.
   3. Qualifications Statements:
      a. Submit qualifications of manufacturer when requested by ENGINEER.
      b. Submit qualifications of installer when requested by ENGINEER.

1.5 DELIVERY, STORAGE AND HANDLING

A. Refer to Section 33 05 05, Buried Piping Installation.

PART 2 PRODUCTS

2.1 SERVICE CONDITIONS

A. General:
   1. Pipe materials shall be suitable for services intended. Refer to piping schedules in Section 33 05 05, Buried Piping Installation.
   2. Pipe shall be homogeneous throughout and free of visible cracks, holes, foreign inclusions, and other defects. Unless otherwise shown or indicated, pipe shall be uniform in color, opacity, density, and other physical properties.
   3. Comply with NSF 14.
   4. Buried pipe shall be capable of withstanding external live load, including impact, equal to AASHTO H-20 loading, with cover shown or indicated on the Drawings.
   5. Pipe, fittings, and appurtenances in contact with potable water or water that will be treated to become potable shall be listed in ANSI/NSF 61 as being suitable for contact with potable water, and shall comply with requirements of the authorities having jurisdiction at the Site.

2.2 POLYVINYL CHLORIDE (PVC) PIPING

A. Buried PVC Gravity Sewer Pipe.
   1. Manufacturers: Provide products of one of the following:
      a. Ipex, Inc.
      b. Diamond Plastics Corp.
      c. Or equal.
   2. Material:
      a. Pipe shall comply with ASTM D3034 or ASTM F679 (as applicable).

b. Wall Thickness and Pipe Stiffness: Pipe stiffness shall be determined in accordance with test methods in ASTM D3034 or ASTM F679 (as applicable).
   1) Main Line: SDR 35, with minimum ring stiffness of 46 psi.
   2) Service Laterals: As specified in Section 33 31 01.

3. Fittings:
   a. Injection-molded, gasketed fittings shall comply with ASTM F1336, and ASTM D3034 or ASTM F679 (as applicable).
   b. Fabricated fittings shall comply with ASTM F1336.
   c. Unless otherwise shown or indicated, saddle wyes are unacceptable.
4. Joints:
   a. Provide bell and spigot joints. Bell shall consist of an integral wall section to hold securely in place (and prevent displacement during assembly of joint) elastomeric O-ring gasket.
   b. Jointing lubricant shall be as recommended by pipe manufacturer.
   c. Provide elastomeric gaskets complying with ASTM F477, and ASTM D3139 or ASTM D3212.

B. Buried PVC Pressure Pipe:
1. Manufacturers: Provide products of one of the following:
   a. Ipex, Inc.
   b. Diamond Plastics Corp.
   c. Or equal.
2. Material:
   a. Pipe shall comply with AWWA C900 or AWWA C905 (as applicable).
   b. Material shall comply with ASTM D1784.
   c. Wall Thickness:
      1) SDR 14 for 4-inch to 12-inch diameter pipe.
      2) SDR 21 for 14-inch to 48-inch diameter pipe.
   d. Fabricate pipe with cast-iron pipe equivalent outside diameter.
3. Fittings:
   a. Comply with AWWA C900, AWWA C905, or AWWA C907, as applicable.
4. Joints:
   a. Provide bell and spigot joints. Bell shall consist of an integral wall section to hold securely in place (and prevent displacement during assembly of joint) elastomeric O-ring gasket.
   b. Jointing lubricant shall be as recommended by pipe manufacturer.
   c. Provide elastomeric gaskets complying with ASTM F477 and ASTM D3139.
   d. Restrained Joints: Provide restrained joints where shown or indicated.
      1) Comply with Section 33 05 05, Buried Piping Installation.
      2) Proprietary Joint Systems: Comply with ASTM F1674. Provide restrained joint system by one of the following for bell and spigot joint PVC piping:
         a) Ebaa Iron Sales, Inc.: Series 1500 and Series 1600 Restraint Harness for C900 Pipe; Megalug Series 2500, 2800, and 1100HV Restraint Harness for C905 Pipe.
         b) PV-LOK Series, by Sigma Corp.
         c) Or equal.

C. PVC Drain, Waste, and Vent (PVC-DWV) Pipe.
1. Manufacturers: Provide products of one of the following:
   a. Chemtrol, manufactured by Nibco, Inc.
   b. Spears Manufacturing Company.

c. Or equal.
2. Material: In accordance with ASTM D1784. Unless otherwise shown or indicated, PVC-DWV pipe shall be:
   a. Type and Grade: Type 1, Grade 1.
   b. Wall Thickness: Schedule 40.
   c. Color: White.
3. Fittings: Manufactured in accordance with ASTM D2665 and ASTM D3311.
   a. Solvent weld.
   b. Spigot.
4. Joints:
   a. Solvent weld.
   b. Threaded.

2.3 CHLORINATED POLYVINYL CHLORIDE (CPVC) PIPING

A. CPVC Pipe – General Applications: Unless otherwise shown or indicated, CPVC pipe shall comply with the following:
   1. Manufacturers: Provide products of one of the following:
      a. Ipex, Inc.
      b. Spears Manufacturing Company.
      c. Or equal.
   2. Material: Comply with ASTM F441/F441M as having same outside diameter as iron pipe. Comply with the following:
      a. Type and Grade: Type IV, Grade 1.
      b. Wall Thickness: Schedule 80.
      c. Temperature Rating: Rated to 210 degrees F.
      d. Color: Gray.
      e. Manufacture pipe and fittings with minimum of two percent of titanium oxide for ultraviolet protection.
   3. Fittings: Type, grade, schedule, and color of fittings shall match the associated pipe.
      a. Solvent Welded: Fittings shall comply with F439 for socket type.
      b. Threaded: Shall comply with ASTM F437.
   4. Joints:
      a. Solvent Welded: Use primer and solvent cement recommended by CPVC pipe manufacturer. Primer shall be in accordance with ASTM F656, and solvent cement shall be in accordance with ASTM D2564.
      b. Threaded: Use 100 percent virgin polytetrafluoroethylene (Teflon or PTFE) tape for threaded fittings. Pipe shall not be threaded.

2.4 IDENTIFICATION

A. Pipe material identification requirements are in Section 33 05 05, Buried Piping Installation.

2.5 SOURCE QUALITY CONTROL

A. Shop Tests:
   1. Pipe manufacturer shall maintain continuous quality control program.
   2. Where applicable and when requested by ENGINEER, submit results of source quality control tests specified in reference standards.

PART 3 EXECUTION

3.1 INSPECTION

A. Inspect pipe materials for defects in material and workmanship. Verify compatibility of pipe and fittings.

3.2 INSTALLATION

A. For buried piping installation, refer to Section 33 05 05, Buried Piping Installation.

END OF SECTION

SECTION 40 05 53

PROCESS VALVES

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install process valves and appurtenances, complete and operational.

B. Coordination:
   1. Review installation procedures under this and other Sections and coordinate installation of items that must be installed with or before process valves Work.

C. Related Sections:
   1. Section 33 05 05, Buried Piping Installation.
   2. Section 40 05 05, Exposed Piping Installation.

1.2 REFERENCES

A. Standards referenced in this Section are listed below:
   1. American Bearing Manufacturers Association (ABMA).
   2. ANSI B16.1, Cast-Iron Pipe Flanges and Flanged Fittings.
   3. ANSI B16.34, Valves-Flanged, Threaded and Welding end. (ASME B16.34).
   4. ANSI/NSF 61 Drinking Water Components – Health Effects.
   5. API STD 594, Check Valves, Flanged Lug, Wafer and Butt-Welding.
   6. API STD 598, Valve Inspection and Testing.
   7. API STD 609, Butterfly Valves: Double Flanged, Lug-Type and Wafer-Type.
   8. ASTM A126, Specification for Gray Iron Castings for Valves, Flanges and Pipe Fittings.
   9. ASTM A193/A193M, Specification for Alloy-Steel and Stainless Steel Bolting Materials for High-Temperature Service.
   10. ASTM A194/A194M, Specification for Carbon and Alloy Steel Nuts for Bolts for High Pressure and High Temperature Service, or Both.
   11. ASTM A240/A240M, Specification for Chromium and Chromium-Nickel Stainless Steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
   12. ASTM A276, Specification for Stainless Steel Bars and Shapes.
   13. ASTM A307, Specification for Carbon Steel Bolts and Studs, 60,000 psi Tensile Strength.
   14. ASTM A351/A351M, Specification for Castings, Austenitic, Austenitic-Ferritic (Duplex), for Pressure-Containing Parts.
   15. ASTM A380, Practice for Cleaning, Descaling and Passivation of Stainless Steel Parts, Equipment and Systems.
   16. ASTM A536, Specification for Ductile Iron Castings.
   17. ASTM A564/A564M, Specification for Hot-Rolled and Cold-Finished Age-Hardening Stainless Steel Bars and Shapes.

18. ASTM A743/A743 M, Specification for Castings, Iron-Chromium, Iron-Chromium-Nickel, Corrosion Resistant, for General Application.
19. ASTM B62, Specification for Composition Bronze or Ounce Metal Castings.
20. ASTM B98/B98M, Specification for Copper-Silicon Alloy Rod, Bar, and Shapes.
21. ASTM B138/B138M, Specification for Manganese Bronze Rod, Bar and Shapes.
22. ASTM B265, Specification for Titanium and Titanium Alloy Strip, Sheet and Plate.
23. ASTM B584, Specification for Copper Alloy Sand Castings for General Applications.
24. ASTM D429, Test Methods for Rubber Property - Adhesion to Rigid Substrates.
25. AWWA C502, Dry-Barrel Fire Hydrants.
26. AWWA C504, Rubber-Seated Butterfly Valves.
27. AWWA C508, Swing-Check Valves for Waterworks Service, 2-inch through 24-inch NPS.
28. AWWA C509, Resilient-Seated Gate Valves for Water Supply Service.
29. AWWA C515, Reduced-Wall, Resilient-Seated Gate Valves for Water Supply Service.
30. AWWA C550, Protective Interior Coatings for Valves and Hydrants.
31. AWWA Manual M49, Butterfly Valves: Torque, Head Loss, and Cavitation Analysis.
32. FS TT-C-494, Coating Compound, Bituminous, Solvent Type, Acid-Resistant.
33. NEMA MG 1, Motors and Generators.
34. MSS SP-60, Connecting Flange Joints Between Tapping Sleeves and Tapping Valves.

1.3 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Manufacturer shall have minimum of five years of experience producing substantially similar materials and equipment to that required and be able to provide evidence of at least five installations in satisfactory operation for at least five years.

B. Component Supply and Compatibility:
   1. Obtain each type of equipment and appurtenances included in this Section, regardless of the component manufacturer, from a single manufacturer of the type of process valve. For each type of valve, do not furnish valves of more than one manufacturer.
   2. Supplier of each type of equipment specified shall review and approve or prepare all Shop Drawings and other submittals for all components associated with the type of process valve Supplier is furnishing.
   3. Components shall be suitable for use in the specified service conditions. Components shall be integrated into the overall assembly by the process valve manufacturer.

1.4 SUBMITTALS

A. Action Submittals: Submit the following:
   1. Shop Drawings:
      a. Installation drawings showing orientation of valve in both plan and elevation view. Drawings shall clearly identify valve and its appurtenances, including controls, actuators, valve stems, and other components. Show dimensions of valves and appurtenances in relation to piping and structural and architectural components, where applicable.
      b. Controls for and control characteristics of modulating valves.
      c. Calculations for sizing of operating mechanism with extension stems.
      d. Calculations for sizing of gear actuators.
   2. Product Data:

a. Product data sheets.
b. Complete catalog information, including dimensions, weight, specifications, and identification of materials of construction of all parts.
c. Corrosion resistance information to confirm suitability of valve materials for the application. Furnish information on chemical resistance of elastomers from elastomer manufacturer.
d. Cv values and hydraulic headloss curves.

3. Testing Plans:
   a. Submit plan for shop testing of each valve for which shop testing is specified, including testing plan's and test facility's limitations proposed.

B. Informational Submittals: Submit the following:
1. Certificates:
   a. Certificates of compliance with referenced standards, where applicable, including those of AWWA, NSF, and others required by ENGINEER.
2. Manufacturer Instructions:
   a. Submit manufacturer's instructions for handling, storing, and installing valves and appurtenances. Provide templates and setting drawings for valves and appurtenances that require anchor bolts or similar anchorages.
3. Source Quality Control Submittals:
   a. Submit copies of shop test results and inspection data, certified by manufacturer.
4. Field Quality Control Submittals:
   a. Submit results of field tests required.
5. Supplier's Reports:
   a. When requested by ENGINEER, submit written report of results of each visit to Site by Supplier's serviceman, including purpose and time of visit, tasks performed and results obtained.
6. Qualifications Statements:
   a. When requested by ENGINEER, submit manufacturer's qualifications demonstrating compliance with the Specifications, including list of existing installations with contact names and telephone number(s) for each.

C. Closeout Submittals: Submit the following:
1. Operations and Maintenance Data:
   a. Furnish operation and maintenance manuals in accordance with Section 01 78 23, Operations and Maintenance Data.
   b. Furnish in operations and maintenance manuals complete nameplate data for each valve.

D. Maintenance Material Submittals: Submit the following:
1. Spare Parts, Extra Stock Materials, and Tools:
   a. Spare Parts and Extra Stock Materials: Furnish as specified for each valve type.

1.5 DELIVERY, STORAGE AND HANDLING

A. Packing, Shipping, Handling, and Unloading:
1. Deliver materials and equipment to Site to ensure uninterrupted progress of the Work. Deliver anchorage products that are to be embedded in concrete in ample time to prevent delaying the Work.

2. Inspect boxes, crates, and packages upon delivery to Site and notify ENGINEER in writing of loss or damage to materials and equipment. Promptly remedy loss and damage to new condition in accordance with manufacturer's instructions.
3. Conform to Section 01 65 00, Product Delivery Requirements.

B. Storage and Protection:
1. Keep products off ground using pallets, platforms, or other supports. Store equipment in covered storage and prevent condensation and damage by extreme temperatures. Store in accordance with manufacturer's recommendations. Protect steel, packaged materials, and electronics from corrosion and deterioration.
2. Conform to Section 01 66 00, Product Storage and Handling Requirements.

PART 2 PRODUCTS

2.1 GENERAL

A. Valves, General:
1. Provide each valve with manufacturer's name and rated pressure cast in raised letters on valve body.
2. Provide valves with brass or Type 316 stainless steel nameplate attached with Type 316 stainless steel screws. Nameplates shall have engraved letters displaying the following minimum information:
a. Valve size.
b. Pressure and temperature ratings.
c. Application (other than water and wastewater).
d. Date of manufacture.
e. Manufacturer's name.
3. Provide hydrants, gate valves larger than 6-inches and butterfly valves to turn counter-clockwise to open, unless otherwise specified. Provide gate valves smaller than 3-inches to turn clockwise to open.
4. Provide valves with permanent markings for direction to open.
5. Manually operated valves, with or without extension stems, shall require not more than 40-pound pull on manual operator to open or close valve against specified criteria. Gear actuator and valve components shall be able to withstand minimum pull of 200 pounds on manual operator and input torque of 300-foot pounds to actuator nut. Manual operators include handwheel, chainwheel, crank, lever, and T-handle wrench.

B. Valve Materials:
1. Valve materials shall be suitable for the associated valve's service or application, as shown.
2. Protect wetted parts from galvanic corrosion caused by contact of different metals.
3. Wetted components and wetted surfaces of valves used with potable water or water that will be treated to become potable shall conform to ANSI/NSF 61.
4. Clean and descale fabricated stainless steel items in accordance with ASTM A380 and the following:
a. Passivate all stainless steel welded fabricated items after manufacture by immersing in pickling solution of six percent nitric acid and three percent hydrofluoric acid. Temperature and detention time shall be sufficient for removing

oxidation and ferrous contamination without etching surface. Perform complete neutralizing operation by immersing in trisodium phosphate rinse followed by clean water wash.

b. Scrub welds with same pickling solution or pickling paste and clean with stainless steel wire brushes or by grinding with non-metallic abrasive tools to remove weld discoloration, and then neutralize and wash clean.

C. Valve Joints:
1. Exposed Valves: Unless otherwise specified, provide with flanged ends conforming to ANSI B16.1. Pressure class of flanges shall be equal to or greater than specified pressure rating of the associated valve.
2. Buried Valves: Unless otherwise specified, provide with mechanical joints, restrained or unrestrained, as required by piping with which valve is installed.
3. For stainless steel bolting, except where nitrided nuts are required, use graphite-free anti-seize compound to prevent galling. Strength of joint shall not be affected by using anti-seize compound.

2.2 RESILIENT-SEATED GATE VALVES

A. Manufacturers: Provide products of one of the following:
1. American Cast Iron Pipe Company, Series 2500 RW.
2. Clow Valve Co., Model 2638, Model 2639 or Model 2640.
3. Kennedy Valve Co., Model KS-FW or Model KS-RW.
4. M&H Valve Co., Style 4067 or Style 7000.
5. Mueller Co., 2361 Series or 2362 Series.
6. Or equal.

B. General:
1. Provide valves conforming to AWWA C509 or C515 and as specified in this Section.
2. Type:
a. Provide non-rising stem (NRS) valves for buried service.
b. Provide NRS valves for exposed service unless specified otherwise.
c. Provide position indicators for NRS valves used in exposed service.
3. Stem seals shall be of the “O” ring type, only.
4. Minimum Rated Working Pressure: 200 psig.
5. Maximum Fluid Temperature: 150 degrees F.
6. Provide valves with fully encapsulated resilient wedges, unless otherwise specified.
7. Gate valves on water mains shall be direct bury gate valves and shall be furnished with standard valves boxes set in concrete pads as specified in Section 03 00 05, Concrete.
8. Valve ends for buried valves shall be mechanical joint with necessary glands, gaskets and bolts furnished with the valve.
9. Valve ends for exposed valves shall be flange joint.

C. Materials of Construction: Shall conform to AWWA C509 or AWWA C515 and shall be as follows:
1. Valve Body, Bonnet, and Stuffing Box: Cast-iron.
2. Wedge: Cast-iron, symmetrically and fully encapsulated with molded rubber having minimum 1/8-inch thickness.
3. Stem: Manganese bronze.
4. Rubber Items: Buna-N or other synthetic rubber suitable for the application.

5. Internal and external bolting and other hardware including pins, set screws, plug, studs, bolts, nuts, and washers shall be Type 316 stainless steel.
6. Valves 3-inch and smaller may be of all bronze construction with iron pipe thread and screw ends and comply with AWWA C509 or C515 and ASTM B62.

D. Interior Coating:
1. Valves shall be coated inside. Steel, cast-iron and ductile iron surfaces, except machined surfaces, shall be epoxy coated in accordance with AWWA C550.

E. Testing:
1. Test valves in valve manufacturer's shop in accordance with AWWA C509 or AWWA C515.

F. Gear Actuators for Manually-operated Valves:
1. Provide valves with gear actuators conforming to AWWA C509 or AWWA C515.
2. Size gear actuators for maximum differential pressures of service requirements.
3. Valves 6-inches and larger shall be furnished with 2-inch square operating nuts.
4. Valves 3-inch and smaller shall be furnished with T-Head operating nuts, unless a hand wheel is specified.

2.3 BUTTERFLY VALVES

A. Manufacturers: Provide products of one of the following:
1. American Cast Iron Pipe Co.
2. Clow Valve Co.
3. Kennedy Valve Co.
4. Mueller Co.
5. Henry Pratt Co.
6. Or equal.

B. General:
1. Provide butterfly valves conforming to AWWA C504 and as specified herein.
2. Rated Working Pressure: 150 psig, Class 150B.
3. Maximum Fluid Temperature: 150 degrees F.
4. Valves shall provide drip-tight bi-directional shutoff at rated pressures.
5. Mount valve seats in valve body. Rubber seats for 24-inch diameter and larger valves shall be replaceable in the field.
6. Valves shall be capable of being maintained in open or partially open position for manual operation, and for automatic operation. When valve disc is maintained, there shall be no chatter or vibration of disc or operating mechanism.
7. Valve packing shall be replaceable without dismantling valve.
8. Disc shall be offset from shaft to provide uninterrupted 360-degree seat seal.

C. Materials of Construction: materials of construction shall conform to AWWA C504 and shall be as follows:
1. Body: Cast-iron, ductile iron, or alloy cast-iron.
2. Shaft: Type 316 stainless steel.
3. Discs:
   a. Valves Smaller than 30-inch Diameter: Cast-iron.
   b. Valves 30-inch Diameter and Larger: Ductile iron.

4. Seats: Buna-N or other synthetic rubber suitable for the application.
5. Seating Surfaces: Type 316 stainless steel.
6. Bearings:
   a. Valves Smaller than 24-inch Diameter: Nylon.
   b. Valves 24-inch Diameter and Larger: Fiberglass with Teflon lining.
7. Shaft Seals: Externally adjustable, material same as for seats. For services that are either buried or submerged, self-adjusting V-type chevron, material same as for seats.
8. Tapered Pins for Attachment of Shaft to Disc: Type 316 stainless steel.
9. Internal and external bolting and other hardware; including pins, set screws, studs, bolts, nuts, and washers shall be Type 316 stainless steel.

D. Interior Coating:
1. Valves shall be coated inside. Steel, cast-iron, and ductile iron surfaces, except machined surfaces, shall be epoxy-coated in accordance with AWWA C550.

E. Testing:
1. Test each valve in the manufacturer's shop in accordance with AWWA C504.

F. Gear Actuators for Manual Valves:
1. Provide gear actuators conforming to AWWA C540.
2. Gear actuators for valves 20-inch diameter and smaller shall be constructed for 150 psi differential pressure and 16 feet per second port velocity.
3. Gear actuators for valves 24-inch diameter and larger shall be constructed for maximum differential pressures and velocities as scheduled.
4. Butterfly valves shall be furnished with a manual operator equipped with a 2-inch square operating nut. The valve and operator shall be assembled for installation in a horizontal line with the main valve shaft horizontal and the operator shaft and operating nut aligned vertically to accept a valve key operated form the surface.

2.4 DETECTOR CHECK VALVES

A. Manufacturers: Provide products of one of the following:
1. Ames Co., Model 3000SS.
2. Febco, Model 800.
3. Watts, 007 Series.
4. Or equal.

B. General:
1. Provide valves conforming to AWWA C508 and as specified herein.
2. Type: Resilient-seated.
3. Rated Working Pressure: 175 psig.
4. Provide valves suitable for horizontal or vertical mounting.
5. Check valves shall have clear waterway with full-open area equal to nominal pipe size.
6. Provide check valves with outside adjustable weight and lever.
7. Provide valves larger than six-inch diameter with adjustable air cushion chambers.
8. Valve seats shall be mechanically attached and shall be field replaceable.
9. Four-inch through ten-inch detector check valves shall have flanged ends per ANSI B16.1, Class 125.
10. Valves shall be furnished with two tapped bosses on each side to permit installation of a metered bypass.

C. Materials of Construction: All materials of construction shall conform to AWWA C508 and shall be as follows:
   1. Body, Disc, Cover and Gland: Cast-iron or ductile iron.
   2. Disc Arm: Ductile iron.
   3. Hinge Shaft: Type 316 stainless steel or bronze.
   4. Hinge Shaft Bushings: Bronze, or Type 316 stainless steel for sewage service.
   5. Shaft End Plate: Type 316 stainless steel or bronze.
   6. Body Seat: Bronze.
   7. Follower Ring for Rubber Seat on Disc: Type 316 stainless steel or bronze.
   8. Disc Center Pin Assembly: Type 316 stainless steel or bronze.
   9. Air Cushion Chamber:
      a. Chamber and Plunger: Bronze.
      b. Linkages and Pins: Type 316 stainless steel or bronze.
      c. Air Check Valve and Tubing: Brass or stainless steel.
   10. Rubber Items:
      a. Applications Up to 180-degree F Fluid Temperature: Buna-N or other synthetic rubber suitable for the application.
      b. Applications 180-degrees F and Greater Fluid Temperature: Viton, or other synthetic rubber suitable for the application.
   11. Internal and external bolting and other hardware; including pins, set screws, studs, bolts, nuts, and washers shall be Type 316 stainless steel.
   12. Gland Packing: Graphite and Kevlar.

D. Interior Coating:
   1. Valves shall be coated inside. Cast-iron and ductile iron surfaces, except machined surfaces, shall be fusion-bonded epoxy coated in accordance with AWWA C550. Steel surfaces shall be hot-dip zinc galvanized or fusion-bonded epoxy coated.

E. Testing:
   1. Test each valve in manufacturer's shop in accordance with AWWA C508.
   2. Allowable Leakage at Rated Pressures: Zero.

2.5 FIRE HYDRANTS

A. Products and Manufacturers: Provide one of the following:
   1. Mueller, Model: Super Centurion 250 A-421.
   2. Or equal.

B. General:
   1. Provide fire hydrants conforming to AWWA C502, Underwriters' Laboratories-listed and Factory Mutual approved, and as specified herein.
   2. Rated Working Pressure: 175 psig, minimum.
   3. Rated Hydrostatic Test Pressure: 400 psig, minimum.
   4. Depth of Cover: Minimum 3-feet.
   5. Inlet: 6-inch mechanical joint.

C. Construction:
   1. Type: Three-way fire hydrants with two hose nozzles and one pumper nozzle.
   2. Nozzles:

a. Provide one minimum 5-inch Storz pumper nozzle and two 2.5-inch diameter hose nozzles with NFPA threads.
b. Nozzles shall be O-ring sealed, threaded, and retained with stainless steel locks. Nozzles shall be field replaceable.

3. Main Valve and Drainage Assembly:
   a. Opening: 4.5-inch minimum diameter.
   b. Main valve shall be compression type provided with upper and lower metal plates and lower valve plate nut.
   c. Barrel drainage shall be through dual drain valves. Opening and closing of main valve shall cause force-flush of dual drain ports.
   d. Main valve seat ring shall be easily replaceable from above-ground.
4. Provide an oil filled reservoir for lubrication of stem threads and bearing surfaces. Oil shall be U.S. Food and Drug Administration approved and ANSI/NSF 61-listed, and shall flow freely in temperature range of -60 to 158 degrees F.
5. Provide traffic flange in barrel and safety coupling in stem.
6. Inlet Connection: Six-inch diameter mechanical joint, restrained.
7. Operating Nut: 1.25-inch and pentagon-shaped.

D. Materials of Construction: Materials of construction shall conform to the requirements of AWWA C502 and shall be as follows:
1. Upper and Lower Barrels, Shoe, and Bonnet: Cast-iron.
2. Stem and Accessories:
   a. Upper and Lower Stems: Steel.
   b. Operating Nut: Bronze.
   c. Safety Coupling: Stainless steel.
3. Nozzles:
   a. Pumper and Hose Nozzles: Bronze.
   b. Nozzle Caps: Cast-iron.
   c. Cap Chains: Steel.
4. Main Valve Assembly:
   a. Main Valve: Rubber.
   b. Upper Valve Plate: Bronze.
   c. Lower Valve Plate and Nut: Cast-iron.
   d. Seat and receiving connection at base of hydrant: Bronze.
5. Drain Valves:
   a. Drain Ring Housing: Cast-iron.
   b. Drain Ring: Bronze.
6. O-ring Gaskets: Rubber.
7. External Assembly Bolts: Steel.
8. Internal Pins and Other Hardware: Stainless steel, ASTM A276.

E. Testing:
1. Test each fire hydrant in manufacturer’s shop in conformance with AWWA C502.

F. Interior Coating:
1. Hydrants shall be coated on the interior. Steel, cast-iron, and ductile iron surfaces, except machined surfaces, shall be epoxy coated in accordance with AWWA C550.

G. Exterior Painting:

1. All hydrants and any portion of hydrant assembly exposed to view shall be painted with minimum 2 even coats of white hydrant enamel paint.
2. Below- and above-ground painting shall be as specified under Article 2.11 of this Section and Article 2.12 of this Section.

H. Appurtenances for Hydrants:
1. Fire hydrant tees shall be Griffin Swivel hydrant Tee, Tyler 5-125 swivel hydrant tee or approved equal.
2. Piping extension for hydrant installations may be made with 6-inch ductile iron nipples with Tyler long swivel hydrant adapters, Megalug MJ Restraint, U.S. Pipe Field Lok Gaskets, Romac Grip Ring, or other approved method.

2.6 APPURTENANCES FOR EXPOSED METALLIC VALVES

A. General:
1. For valves located less than five feet above operating floor, provide levers on four-inch diameter quarter-turn valves, and provide handwheels on all other valves, unless otherwise shown or specified.
2. For valves located five feet or more above operating floor, provide chain operators.
3. Where indicated, provide extension stems and floorstands.

B. Handwheels:
1. Conform to applicable AWWA standards.
2. Material of Construction: Ductile iron or cast aluminum.
3. Arrow indicating direction of opening and word “OPEN” shall be cast on trim of handwheel.
4. Maximum Handwheel Diameter: 2.5 feet.

C. Crank Operator:
1. Crank operator shall be removable and fitted with rotating handle.
2. Maximum Radius of Crank: 15 inches.
3. Materials:
   a. Crank: Cast-iron or ductile iron.
   b. Handle: Type 304 stainless steel.
   c. Hardware: Type 304 stainless steel.

D. Extension Stems and Floor Stands for Gate Valves:
1. Conform to the applicable requirements of AWWA C501 for sizing of complete lifting mechanism.
2. Bench and Pedestal Floor Stands:
   a. For valves requiring extension stems, provide bench or pedestal floor stands with handwheel or crank as indicated. Provide provisions for using portable electric actuator for opening and closing of valves.
   b. Type: Heavy-duty with tapered roller bearings enclosed in a weatherproof housing, provided with positive mechanical seals around lift nut and pinion shaft to prevent loss of lubrication and to prevent moisture from entering housing. Provide lubrication fitting for grease. For valves conveying water that is potable or that will be treated to become potable, grease shall be food-grade and ANSI/NSF 61-listed. Base shall be machined.
   c. Materials of Construction:

1) Housing: Cast-iron, ASTM A126, Class B.
2) Lift Nut: Cast bronze, ASTM B98/B98M.
3) Grease Fitting: Stainless steel.
4) Bolting: Type 316 stainless steel.

3. Wall brackets for floor stands shall be Type 316L stainless steel construction.
4. Extension Stems:
   a. Materials of Stems and Stem Couplings: Type 316 stainless steel.
   b. Maximum Slenderness Ratio (L/R): 100.
   c. Minimum Diameter: 1.5-inch.
   d. Threads: Acme.
   e. Provide stem couplings where stems are furnished in more than one piece. Couplings shall be threaded and keyed or threaded and bolted and shall be of greater strength than the stem.
   f. Weld to bottom of extension stem a Type 316 stainless steel cap suitable for square end of valve stem.
5. Bottom Couplings: Ductile iron with Type 316 stainless steel pin and set screw.
6. Stem Guides:
   a. Material: Type 316 cast stainless steel with bronze bushing for stem. For submerged service, Type 316 cast stainless steel with stainless steel bushing for stem.
   b. Maximum Stem Length Between Guides: Seven feet.
   c. Stem guides shall be adjustable in two directions.
7. Furnish stem cover of clear butyrate plastic or Grade 153 Lexan with cast adapter for mounting cover to bench and floor stands. Provide stem cover with gasketing and breathers to eliminate water intrusion into operator and condensation within cover. Provide stem cover with mylar tape with legible markings showing valve position at one-inch intervals and open and close limits of valve.

E. Floor Boxes: Provide cast-iron floor boxes for valves that are to be operated from floor above valve. Boxes shall be equal in depth to floor slab. Boxes shall have cast-iron covers and be fitted with bronze bushing.

2.7 APPURTENANCES FOR BURIED METALLIC VALVES

A. Wrench Nuts:
   1. Provide wrench nuts on buried valves of nominal two-inch size, in accordance with AWWA C509.
   2. Arrow indicating direction of opening the valve shall be cast on the nut along with the word “OPEN”.
   3. Material: Cast-iron.
   4. Secure nut to stem by mechanical means.

B. Extension Stems for Non-Rising Stem Gate Valves and Quarter-turn Buried Valves:
   1. Provide extension stems to bring operating nut to six inches below valve box cover.
   2. Materials of Stems and Stem Couplings: Type 316 stainless steel.
   3. Maximum Slenderness Ratio (L/R): 100
   4. Provide top nut and bottom coupling of ductile iron or cast-iron with pins and set screws of Type 316 stainless steel.

C. Valve Boxes:

1. Valve boxes shall be as indicated and as required.
2. Type: Heavy-duty, suitable for highway loading, two-piece telescopic, and adjustable. Lower section shall enclose valve operating nut and stuffing box and rest on valve bonnet.
3. Material: Cast-iron.
4. Coating: Two coats of asphalt varnish conforming to FS TT-C-494.
5. Marking: As required for service.

2.8 TAPPING SLEEVES

A. Products and Manufacturers: Provide one of the following:
   a. Ford Fast.
   b. Romac STS420.
   c. Smith-Blair Model 663.
   d. JCM Industries Model 432.
   e. PowerSeal 3480AS.
   f. PowerSeal 3490AS.
   g. Or approved equal.

B. General:
   1. Application: Potable water service distribution water line.
   2. Tapping sleeves shall be stainless steel or epoxy-coated steel full gasket with wedge gaskets around tap openings.
   3. Stainless steel sleeves shall be 18/8, Type 304 stainless steel.
   4. Tapping sleeves shall include test plugs.
   5. Tapping sleeves 12-inch and smaller shall meet minimum working pressure requirement of 200 psi.
   6. Tapping sleeves 14-inch and larger shall meet minimum working pressure requirement of 150 psi.

C. Construction:
   1. Sleeve outlet flange shall be stainless steel and be Class D per AWWA C207 ANSI 150 pound drilling compatible with approved tapping valves.
   2. Flanged end shall feature lip in accordance with MSS SP-60.
   3. Sleeve gasket shall be of a grid pattern design and shall provide full circumferential sealing around the tapped pipe.
   4. All welds of tapping sleeve shall be passivated.
   5. Tapping valves shall conform to the specifications and approved brands as outlined in this Section.
   6. Tapping valves shall have oversized seat rings and feature one flanged end and one standard mechanical joint.

2.9 ANCHORAGES AND MOUNTING HARDWARE

A. General:
   1. Bolts, nuts, and washers shall be of ample size and strength for purpose intended. Anchorages in concrete shall be at least 5/8-inch diameter.
   2. Provide stem guide anchorages of required strength to prevent twisting and sagging of guides under load.

3. Materials: Provide bolts and washers of Type 316 stainless steel and nitrided nuts. Bolts shall have rolled threads. Bolts and nuts shall be electropolished to remove burrs.

2.10 TOOLS, LUBRICANTS, AND SPARE PARTS

A. Provide T-handle operating wrenches for buried valves as required by the County.

B. Lubricants: For valves, actuators, and appurtenances requiring lubricants, provide suitable lubricants for initial operation and for first year of use following Substantial Completion. Lubricants for equipment associated with conveying potable water or water that will be treated to become potable shall be food-grade and ANSI/NSF 61-listed.

C. Provide tools, spare parts, and maintenance materials.

2.11 PAINTING OF EXPOSED VALVES, HYDRANTS, AND APPURTENANCES

A. Exterior steel, cast-iron, and ductile iron surfaces, except machined surfaces of exposed valves and appurtenances, shall be finish painted in manufacturer's shop. Surface preparation, priming, finish painting, and field touch-up painting shall conform to the manufacturer's paint standards.

2.12 PAINTING OF BURIED VALVES

A. Exterior steel, cast-iron, and ductile iron surfaces, except machined or bearing surfaces of buried valves, shall be painted in valve manufacturer's shop with two coats of asphalt varnish conforming to FS TT-C 494.

PART 3 EXECUTION

3.1 INSPECTION

A. Examine conditions under which materials and equipment are to be installed and notify ENGINEER in writing of conditions detrimental to proper and timely completion of the Work. Do not proceed with the Work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General:
   1. Install valves and appurtenances in accordance with:
      a. Supplier's instructions and the Contract Documents.
      b. Requirements of applicable AWWA standards.
      c. Applicable requirements of Section 33 05 05, Buried Piping Installation, and Section 40 05 05, Exposed Piping Installation.
   2. Install valves plumb and level. Install all valves to be free from distortion and strain caused by misaligned piping, equipment, and other causes.

3. Position detector check valves and butterfly valves so that, when valve is fully open, valve disc does not conflict with piping system elements upstream and downstream of valve.

B. Exposed Valves:
   1. Provide supports for large or heavy valves and appurtenances as shown or required to prevent strain on adjoining piping.
   2. Operators:
      a. Install valves so that operating handwheels or levers can be conveniently turned from operating floor without interfering with access to other valves, piping, structure, and equipment, and as approved by ENGINEER.
      b. Avoid placing operators at angles to floors or walls.
      c. Orient chain operators out of way of walking areas.
      d. Install valves so that indicator arrows are visible from floor level.
      e. For motor-operated valves located lower than five feet above operating floor, orient motor actuator to allow convenient access to pushbuttons and handwheel.
   3. Floor Stands and Stems:
      a. Install floor stands as shown and as recommended by manufacturer.
      b. Provide lateral restraints for extension bonnets and extension stems as shown and as recommended by manufacturer.
      c. Provide sleeves where operating stems pass through floor. Extend sleeves two inches above floor.

C. Buried Valves:
   1. Install valve boxes plumb and centered, with soil carefully tamped to a lateral distance of four feet on all sides of box, or to undisturbed trench face if less than four feet.

D. Hydrants:
   1. Hydrant drains shall not be connected to, or located within 10 feet of, sanitary sewer systems.
   2. Install tracer wire per fire hydrant detail.

E. Tapping Sleeves:
   1. Place the lower half of the tapping sleeve under the pipe to be tapped. Support sleeve with blocks and place the gaskets. Place the upper half of the sleeve over the pipe, insert the bolts, rotate the sleeve to proper position and tighten the nuts evenly. Bolt tapping valve to the sleeve outlet, attach tapping machine to the valve, drill and tap central hole and cut outlet in main. After opening has been made, withdraw the drill, cut-out portion of pipe wall and the cutter and close tapping valve. Remove and temporary extension piping used to make connection.
   2. Coat threads on tapping sleeve bolts with anti-gall coating prior to installation.
   3. Leave newly-installed tapping sleeve and valve exposed for a minimum period of 24 hours to permit inspection of the joints and valve for leaks. Test at same hydrostatic pressure as that present in existing main.
   4. Correct all visible leaks, if any, at no additional cost to Owner. After such leaks have been sealed, again leave sleeve and valve exposed for a minimum period of 24 hours. Repeat this procedure until Engineer accepts installation and then commence backfilling.

3.3 FIELD QUALITY CONTROL

A. Field Tests:
   1. Adjust all parts and components as required to provide correct operation of valves.
   2. Conduct functional field test on each valve in presence of ENGINEER to demonstrate that each valve operates correctly.
   3. Verify satisfactory operation and controls of motor operated valves.
   4. Demonstrate satisfactory opening and closing of valves at specified criteria requiring not more than 40 pounds effort on manual actuators.
   5. Test ten percent of valves of each type by applying 200 pounds effort on manual operators. There shall be no damage to gear actuator or valve.

B. Tests for Tapping Sleeves
   1. Perform hydrostatic and leakage tests on tapping sleeves in accordance with AWWA C600.
   2. All leaks and any defective material shall be repaired or replaced to the satisfaction of the Engineer and the tests repeated until the requirements of this specification are met.
   3. Furnish any special equipment required to conduct the test.
   4. If hydrants or other openings are not available for the purpose of expelling air, provide air releases of sufficient size (as determined by the Engineer) in accordance with the Drawings at the Contractor's expense.
   5. Test pressure shall be held for at least 2 hours at minimum 150% the maximum working pressure at the low point of the section being tested. If testing against butterfly valves, the differential pressure must not exceed 150 psi for valves rated at 150 psi.
   6. If the test cannot be executed with differential pressure of 150 psi, a 250 psi valve shall be specified.
   7. Differential test pressures against gate valves shall not exceed 200 psi.
   8. Allowable leakage shall be determined by AWWA C600.

END OF SECTION

SECTION 40 05 86

AIR VALVES FOR WATER AND WASTEWATER SERVICE

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish, install, and test Air Valves for water and wastewater service complete with appurtenances.
   2. This Section does not include:
      a. Valves specified in other Sections
      b. Valves furnished with equipment
      c. Non-metallic valves.

B. Coordination:
   1. Review installation procedures for this and other Specification sections and coordinate Work that must be installed with or before Work under this Section.
   2. If this is a multiple-prime contract project, provide timely advance notification of schedule of work to other contractors who may need to install items at same time or before Work included in this Section.

C. Related Sections:
   1. Section 40 05 53, Process Valves

1.2 REFERENCES

A. Standards referenced in this Section are:
   1. ANSI/AWWA C512, Air Release, Air Vacuum and Combination Air Valves for Waterworks Service
   2. ANSI/AWWA C550, Protective Interior Coatings for Valves and Hydrants.
   3. ANSI/NSF 61 Drinking Water Components – Health Effects

1.3 DEFINITIONS

A. The following definitions apply to this Section.
   1. Air Release Valve: A hydromechanical device designed to automatically release to atmosphere small pockets of air as they accumulate in a pipeline when pipeline system is full and operating under pressure.
   2. Air/Vacuum Valve: Direct-acting, float-operated, hydromechanical device designed to automatically release or admit large volumes of air during filling or draining of a pipeline or piping system. Valve will open to relieve negative pressures and will not reopen to vent air when system is full and under pressure.
   3. Air Valve: Valve of one of the following types: Air Release Valve, Air/Vacuum Valve, or Combination Air Valve.
   4. Maximum and Minimum Working Pressure: Pressure range at which valve is designed to function.

5. Orifice: Opening in valve mechanism through which air is expelled from or admitted into pipeline or piping system.
6. Valve Design Pressure: Maximum pressure to which a valve may be subjected without exceeding allowable stress of its components.

1.4 QUALITY ASSURANCE

A. Manufacturer's Qualifications:
   1. Manufacturer shall be able to provide documentation of at least five installations of substantially similar equipment to that specified, in satisfactory operation for at least five years.

B. Component Supply and Compatibility:
   1. Valves of the same type, including specified accessories, shall be products of or furnished by a single air valve manufacturer.

C. Regulatory Requirements.
   1. Drinking Water Requirements: Valves that will be in contact with potable water or water that will be treated to become potable shall comply with ANSI/NSF 61 and the Safe Drinking Water Act.

1.5 SUBMITTALS

A. Action Submittals.
   1. Product Data: Submit the following for each type and size of valve specified:
      a. Product data sheet.
      b. Complete catalog information, including dimensions, weight, performance data, Orifice size, specifications, and identification of materials of each part.

B. Informational Submittals:
   1. Certifications:
      a. Submit a certificate signed by manufacturer of each product stating that product conforms to applicable referenced standards and specified requirements.
   2. Test Reports:
      a. Provide results of successful factory tests prior to shipping products to the Site.
   3. Manufacturer's Reports:
      a. Submit written report of results of each visit to Site by a manufacturer's serviceman, including purpose and time of visit, tasks performed, and results obtained.

C. Closeout Submittals.
   1. Operation and Maintenance Data:
      a. Submit complete operation and maintenance manual for all Air Valves in the Contract, including maintenance data and schedules in sufficient detail for disassembly and assembly of valve, and identifying parts that can be replaced.
      b. Furnish operation and maintenance manuals per Section 01 78 23, Operations and Maintenance Data.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Packing, Shipping, Handling, and Unloading:
   1. Prepare valves for shipping per Section 6.2 of ANSI/AWWA C512.
   2. Conform to Section 01 65 00, Product Delivery Requirements.

B. Acceptance at Site:
   1. Inspect all boxes, crates, and packages upon delivery to Site and notify ENGINEER in writing of loss or damage to products. Promptly remedy loss and damage to new condition per manufacturer's instructions.

C. Storage and Protection:
   1. Keep all products off ground using pallets, platforms, or other supports. Protect products from corrosion and deterioration.
   2. Conform to Section 01 66 00, Product Storage and Handling Requirements.

1.7 MAINTENANCE

A. Extra Materials (for capital projects):
   1. Furnish complete valves or sets of field replaceable parts for each type and size of valve installed, tagged and boxed for long-term storage as follows:

Quantity of Valves Installed	**Spare Valves (1) or Sets of Spare Parts (2)**
1 to 5	1
6 to 10	2
11 to 15	3
16 or more	5

Notes:
(1) For valves smaller than 4-inch diameter furnish complete valve instead of sets of spare parts. Complete valve does not include accessories that are not typically furnished with valve model.
(2) Set of field-replaceable spare parts includes one gasket and all field-replaceable seats and bushings.

PART 2 PRODUCTS

2.1 GENERAL

A. Extent:
   1. Provide valves included in this Section and as shown on the Drawings.

B. Requirements:
   1. Size: Air valve shall be sized per manufacturer's recommendations.
   2. Valve Design Pressure: Unless otherwise specified, Valve Design Pressure shall be equal to or exceed design pressure of pipe or equipment on which the valve is installed.
   3. Valve Type, Service, Inlet Size, Orifice Size, Accessories, and Required Features: Provide per the Drawings.

4. Materials: Air Valve materials shall be suitable for long-term use in the service specified.
5. Ends:
   a. Provide per the Drawings.
   b. Comply with valve connection requirements in Section 4.3 of ANSI/AWWA C512.
6. Operating Pressure Range: Valve Design Pressure shall be greater than the valve's Maximum and Minimum Working Pressure.
7. Air Valves in water service shall comply with ANSI/AWWA C512 unless otherwise shown or specified.
8. Air/ Vacuum Valves in wastewater service to be long body type, furnished with back flushing attachments.

C. Markings:
1. Mark valves per Section 6.1 of ANSI/AWWA C512.

D. Manufacturers:
1. Apco Valves.
2. Crispin Valves.
3. GA Industries.
4. Val-Matic Valve & Manufacturing Corporation.
5. Henry Pratt.
6. Or equal.

2.2 ACCESSORIES

A. Isolating Valves:
1. Provide isolating valves as shown in the Drawings.

B. Anti-Slam Devices for Water Service:
1. Provide anti-slam devices on inlet to air/vacuum valves where indicated.
2. Pressure rating of anti-slam device shall equal or exceed Valve Design Pressure of connected Air Valve.
3. Ends shall be as required for connecting to Air Valve.
4. Anti-slam devices shall be as normally furnished by specified Air Valve manufacturers and be cast iron or ductile iron with bronze or stainless steel disc and trim.

C. Back-flush Attachments for Wastewater Service:
1. Unless otherwise indicated, provide back-flush attachment for Air Valves.
2. Back-flush attachments shall be as normally furnished by specified Air Valve manufacturer. Provide ports in the Air Valve body for flushing and discharge, each with an isolating valve and quick-connect for attaching hoses.
3. Provide five-foot length of rubber hose with quick-connect for connecting to flushing discharge port.
4. Provide a plugged 2-inch diameter NPT port at bottom of Air Valve body for removal of solids.

D. Vacuum Check Valves:
1. Provide vacuum check valves for Air Release Valves where indicated.
2. Vacuum check valves shall be as normally furnished by Air Valve manufacturer.

E. Throttling Devices
   1. Provide throttling device on discharges of Air/Vacuum Valves where indicated.
   2. Throttling device shall have a field-adjustable Orifice and be as normally furnished by Air Valve manufacturer.

F. Inflow Prevention Devices for Water Service:
   1. Extent: Provide where indicated.
   2. Design: System shall allow connected Air Valve to function normally under normal (non-flooded) conditions.
   3. Size: Venting capacity shall be equal to or greater than connected Air Valve:
   4. Connections: Provide female threaded connections for Air Valve of 1 to 4 inches, and flat faced flanges drilled per ANSI B16.1 Class 125 for larger sizes.
   5. Products and Manufacturers: Provide products of one of the following:
      a. Val-Matic, Series 1300.
      b. Or equal.

2.3 FACTORY PAINTING

A. Interior Surfaces
   1. Extent: Paint ferrous surfaces except stainless steel surfaces.
   2. Paint: Paint shall be as normally provided by Air Valve manufacturer for the specified application, except for potable water service valves which shall be coated with paint complying with ANSI/AWWA C550 and ANSI/NSF-61.

B. Exterior Surfaces
   1. Exterior surfaces of cast-iron, ductile iron, and steel other than stainless steel, except machined surfaces of valves and appurtenances, shall be finish painted.
   2. Surface preparation, painting, and field touch-up painting shall be per manufacturer's paint standards.
   3. Furnish valve with only a prime coat if so indicated.

2.4 SOURCE QUALITY CONTROL

A. Test and inspect Air Valves per Section 5 of ANSI/AWWA C512. Do not ship valves that are not successfully tested.

PART 3 EXECUTION

3.1 INSPECTION

A. Examine conditions under which Work is to be installed and notify ENGINEER in writing of conditions detrimental to proper and timely completion of Work. Do not proceed with Work until unsatisfactory conditions have been corrected.

B. Examine valves and remove packing and foreign materials from interior of valve. Report defects to ENGINEER

3.2 INSTALLATION

A. Install valves and appurtenances as shown on the Drawings and per Air Valve manufacturer's recommendations, approved Shop Drawings, and applicable codes and standards.

B. Install valves plumb and vertical.

C. Install with an isolating valve. Remove isolating valve's operating handle or lever and deliver to OWNER.

D. Adjust throttling devices, if provided, for smooth, non-slam and waterhammer-free operation.

END OF SECTION

SECTION 43 21 39

PUMPING STATION – SUBMERSIBLE TYPE WITH VALVE VAULT

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install submersible type pumping station with valve vault, complete and operational.

B. Related Sections:
   1. Section 03 00 05, Concrete.
   2. Section 31 23 05, Excavation and Fill.
   3. Section 32 12 00, Flexible Paving.
   4. Section 32 92 00, Lawns and Meadows.
   5. Section 40 05 05, Exposed Piping Installation.
   6. Section 40 05 08, Wall Pipes, Floor Pipes and Pipe Sleeves.
   7. Section 40 05 19, Ductile Iron Process Pipe.
   8. Section 40 05 53, Process Valves.
   9. Section 43 21 39.13, Submersible Pumps.

1.2 SECTION INCLUDES

A. Submersible type pumping station with valve vault, and including:
   1. Excavating and backfilling.
   2. Wet well with resilient connectors, steel supports, electrical handhole, and vent.
   3. Valve vault with floor door, manhole steps, and vent.
   4. Anchor bolts and anchors.
   5. Submersible pumps with pump guide assemblies, pump access doors, and pump controls.
   6. Piping for pump discharges and drains.
   7. Asphalt pavement.
   8. Electrical.
   9. Painting.
   10. Landscaping.

1.3 SUBMITTALS

A. Provide Manufacturer Standard Submittal Drawings, Operating and Maintenance Instruction Manuals and Parts List to the Engineer. Standard Submittals shall consist of:
   1. Pump Performance Curves.
   2. Pump Outline Drawing.
   3. Station Drawing for Accessories.
   4. Electrical Motor Data.
   5. Control Drawing and Data.
   6. Access Cover Dimensions Minimum.
   7. Typical Installation Guides.

8. Technical Manuals.
9. Operation and Maintenance Manual.
10. Parts List.
11. Printed Warranty.
12. Manufacturer's Equipment Storage Recommendations.
13. Manufacturer's Standard Recommended Start-Up Form.
14. Certified Factory Test Pump Curve.

B. Furnish a manufacturer's affidavit indicating that the pipe, fittings, and valves have been manufactured and tested in accordance with requirements of the applicable referenced Standards, and the Project on which the material is to be used prior to construction.

1.4 DESIGN REQUIREMENTS

A. Design precast structures to meet loading requirements of AASHTO Classification H-20.

B. Minimum Lateral Earth Pressure: 60 pcf.

C. Design for groundwater level no more than 5 feet below grade.

1.5 QUALITY ASSURANCE

A. Precast Concrete Structures:
   1. Qualifications: The precaster shall be PCI-certified; design shall be sealed by a Professional Engineer licensed to practice in the State of South Carolina.
   2. Inspections: ENGINEER reserves the right to inspect the precasting facility prior to and during fabrication, and to collect samples of materials during the fabrication process for testing. Manufacturer shall accommodate facility inspection and sample collection.

B. Piping:
   1. Pipe and fittings to be appropriately marked for identification purposes.
   2. The materials and methods of manufacture, and completed pipes, fittings, and valves are subject to inspection and rejection at all times. OWNER and ENGINEER have the right to make inspections.
   3. Valve manufacturer's name, valve size, pressure rating, and direction of opening to be marked on valve.

PART 2 PRODUCTS

2.1 EXCAVATION AND FILL

A. Fill Materials: Follow Section 31 23 05, Excavation and Fill.

2.2 WET WELL

A. Walls:
   1. Precast reinforced concrete sections; comply with ASTM C478.
   2. Joints: Tongue and groove with rubber gaskets; comply with ASTM C443.

3. Flexible Plastic Gasket Material: Federal Specification SS-S-210A and AASHTO M-198B; Hamilton-Kent Manufacturing Company, Concrete Sealants, Inc., or as approved.

B. Top and Bottom Slabs: Class I concrete; follow Section 03 00 05, Concrete.

C. Concrete Fill: Class II concrete; follow Section 03 00 05, Concrete.

D. Resilient Connector: Comply with ASTM C923.
   1. Manufacturers:
      a. A-Lok Products, Inc., A-Lok Connector.
      b. National Pollution Control Systems, Inc., Kor-N-Seal.
      c. Or as approved.

E. Pipe Brace and Concrete Pipe Support Beam Angle:
   1. Structural steel; ASTM A36.
   2. Type 316 stainless steel expansion anchors.

F. Vent:
   1. Schedule 40 black steel pipe, ASTM A53, Grade B with welded or flanged joints; or ductile iron pipe, AWWA C150 and C151, Class 50 with flange joints. Provide required wall casting. Provide outlet with a bronze wire screen, 0.063-inch diameter wire, 2 mesh size, mechanically held in place between two flanges.

2.3 VALVE VAULT

A. Walls, Top and Bottom Slabs:
   1. Minimum compressive strength 5,000 psi at 28 days; air entrainment of 6 percent, ±1 percent; follow Section 03 00 05, Concrete.
   2. Reinforcing steel meeting ASTM A615 or A616, certified Grade 60.
   3. Welded wire fabric conforming to ASTM A185.
   4. Poured and vibrated and constructed using steel forms.
   5. Wall joints with tongue and groove design; sealed water-tight with gasket and polyurethane sealant.
   6. Wall penetrations for drain piping field-cored.

B. Floor Door and Drain Piping:
   1. Manufacturers:
      a. Babcock-Davis Hatchways, Series B-FGA-H.
      b. The Bilco Company, Type J-AL, H-20.
      c. Halliday Products, Inc., Series H1W.
      d. Or as approved.
   2. Load Rating: AASHTO H-20 wheel loading.
   3. Frame:
      a. Material: Extruded aluminum sections shaped to serve as a continuous drainage gutter with a 1-1/2 inch drain coupling.
      b. Anchors: Continuous anchor flange.
      c. Apply manufacturer's standard protective coating to surfaces of frame that will be in contact with concrete.
   4. Cover:

a. Material: 1/4 inch mill finish aluminum diamond plate, reinforced with stiffening ribs.
b. Hinges: Stainless steel; butt type with compression spring operators enclosed in telescopic tubes.
c. Hold Open Arm: Stainless steel; automatically locks door at 90 degree position; provide vinyl grip handle to release door for closing.
d. Lock: Stainless steel; slam type with fixed handle inside and removable key wrench outside.

5. Hardware and Fasteners: Type 316 stainless steel.
6. Accessories: Provide one key wrench for each door supplied.
7. Drain Piping: Follow paragraph 2.6.C in this Section.

C. Manhole Steps:
1. 1/2 inch diameter steel reinforcing rod continuous through entire length of legs and tread, encapsulated in a copolymer polypropylene plastic.
2. Provide steps with notched tread ridge and retainer lugs on each side of tread ridge.
3. Provide grab bar where indicated.

D. Vent: Schedule 40 black steel pipe, ASTM A53, Grade B, with welded or flange joints; or ductile iron pipe, AWWA C150 and C151, Class 50 with flange joints. Provide required wall casting. Provide outlet with a bronze wire screen, 0.063 inch diameter wire, No. 2 mesh size, mechanically held in place between two flanges.

E. Sump Drain Piping: Follow paragraph 2.6.C in this Section.

2.4 ANCHOR BOLTS AND EXPANSION ANCHORS

A. Anchor Bolts Cast-In-Concrete:
1. Comply with ASTM F593, Type 316 stainless steel.
2. 4 inch minimum hook.

B. Expansion Anchors:
1. Manufacturers:
a. Hilti Corporation, Kwik Bolt II.
b. ITW Ramset/Red Head, Trubolt Wedge Anchor.
c. The Powers Rawl Company, Inc., Power-Stud.
d. Or as approved.
2. Expansion Type: Comply with Federal Specification FF-S-325 Group II, Type 4, Class I.
3. Type 316 stainless steel.
4. Minimum Embedment: 4 inches, unless otherwise indicated.

2.5 SUBMERSIBLE PUMPS

A. Follow Section 43 21 39.13, Submersible Pumps; includes submersible pumps, pump guide assemblies, pump access doors, and pump controls.

2.6 PIPING

A. Piping Schedule:

Application	Material
Submersible pumps discharge to and including connection with force main	Ductile Iron
Valve Vault floor door drain to the sump	PVC
Valve Vault gravity sump drain to wet well	PVC

B. Ductile Iron Pipe and Fittings: Follow Section 40 05 19, Ductile Iron Process Pipe.
   1. Pipe:
      a. Buried: Designed in accordance with AWWA C150 and manufactured in accordance with AWWA C151; minimum Thickness Class 52, with polyethylene encasement; mechanical joint or push-on joint.
      b. Exposed: AWWA C115 flanged joint.
   2. Fittings: AWWA C110.
   3. Exterior Coating: Asphaltic material for buried and within wet well; factory-applied prime coat for all other. Buried fittings may be coated with a fusion-bonded epoxy coating in accordance with AWWA C116.
   4. Interior Lining: Ceramic epoxy lining, Protecto 401 Ceramic Epoxy.
   5. Joints:
      a. Mechanical and Push-On: AWWA C111, rubber gasket, with restrained joints.
         1) Restrained Push-On: Completely boltless; McWane Push-On Restrained Joint Pipe, U.S. Pipe TR Flex, American Flex-Ring, or as approved.
         2) Restrained Mechanical: EBAA Iron, Inc. MEGALUG with Mega-Bond Coating System, or as approved, of ductile iron, and with a working pressure of at least 250 psi, and a minimum safety factor of 2:1.
      b. Flanged: Appendix A of AWWA C115, and ANSI B16.1, Class 125; ductile iron flanges; zinc-plated bolts and nuts.
      c. Bolted Joints: Bolt length shall be such that all threads of the nut will be engaged.
   6. Wall Castings:
      a. Ductile iron; AWWA C110; coated and lined as specified for pipe.
      b. Provide with integral water stop.
      c. End Connections: As indicated on Drawings.
      d. Length: As required for wall thickness.
   7. Polyethylene Encasement: AWWA C105 polyethylene tube; 2 inch wide, plastic-backed adhesive tape, bond to both metal surfaces and polyethylene tube.
   8. Pipe, Fittings, and Appurtenances: Manufactured in United States.

C. PVC Pipe and Fittings:
   1. Pipe: ASTM D1785, Schedule 80.
   2. Joints:
      a. Socket: Solvent-welded.
      b. Threaded: Taper pipe threads.
      c. Flanged: One-piece solid design; compatible with ANSI B16.5, Class 160 metal flanges.
   3. Fittings:
      a. Socket: ASTM D2467.
      b. Threaded: ASTM D2464.
   4. Unions: O-ring seal type; transition type for joining dissimilar materials.

D. Valves:
   1. Plug Valves:
      a. Type: Non-lubricated eccentric plug with resilient plug facings.
      b. Body: Cast iron; ASTM A126, Class B.
      c. Seat: Raised seat with 1/8-inch welded overlay of 90 percent pure nickel. Screw-in seats are not acceptable.
      d. Plug: Cast iron; ASTM A126, Class B; cylindrical seating surface, faced with chloroprene or neoprene, as instructed by manufacturer based on type of service.
      e. Bearings: Stainless steel sleeve type, permanently lubricated. Non-metallic bearings are not acceptable.
      f. Shaft Seals: Multiple V-ring type, externally adjustable and repackable without removing bonnet.
      g. Operator: Valves less than 6 inches, lever actuator. Equip valves 6 inches and larger with gear actuators and handwheel. Enclose gearing in semi-steel housing; provide seals on all shafts; support actuator shaft on permanently lubricated bronze bearings.
      h. Manufacturers: DeZurik, PEC, or as approved.
   2. Swing Check Valves:
      a. Type: Full opening swing type with outside lever and weight, suitable for horizontal or vertical installation. Clapper to swing completely clear of waterway.
      b. Body: Cast Iron; ASTM A126, Class B.
      c. Clapper: For valve sizes as follows:
         1) 4 Inches and Smaller: Bronze.
         2) 6 Inches through 12 Inches: Cast iron with bronze face.
         3) 14 Inches and Larger: Cast iron with rubber face.
      d. Hinge Pin: Stainless steel.
      e. Outside Lever and Weight: Cast iron.
      f. Manufacturers:
         1) M&H Valve Company.
         2) Mueller Company.
         3) Or as approved.
   3. Ball Check Valves, Plastic:
      a. Type: True union design; suitable for horizontal or vertical installation.
      b. Body and Ball: PVC.
      c. Seats and Seals: EPDM or Viton as instructed by manufacturer for intended service.
      d. Manufacturers:
         1) Asahi/America.
         2) Chemtrol.
         3) Or as approved.

E. Pipe Sleeves:
   1. Material: Standard weight steel pipe or 18 gage galvanized steel.
   2. Integral waterstop collar.
   3. Size:
      a. Diameter: Large enough to allow for movement due to expansion and contraction. Allow for continuous insulation wrap.
      b. Length: Flush with wall or floor, unless otherwise indicated.

F. Mechanical Type Seal:

1. Manufacturers: Pipe Seal International, Link-Seal, service designation S; or as approved.
2. Design: Modular mechanical type, consisting of interlocking synthetic rubber links, shaped to fill the annular space between the pipe and sleeve.
3. Size: As instructed by manufacturer based on pipe size and opening size.
4. Sealing Element: EPDM rubber.
5. Pressure Plate: Glass-reinforced nylon plastic.
6. Bolts and Nuts: Type 304 stainless steel.

G. Pipe Couplings for Ductile Iron Pipe:
1. Manufacturers:
   a. Baker Coupling Company, Inc., Series 200.
   b. Dresser Industries, Style 38.
   c. Smith-Blair, Inc., 411.
   d. Or as approved.
2. Type: AWWA C219, bolted-gasketed sleeve type.
3. Components:
   a. Steel middle ring.
   b. Two steel followers.
   c. Two-rubber compound, wedge-shaped gaskets suitable for service intended.
   d. Track-head steel bolts and nuts.
4. Size: As instructed by manufacturer based on pipe diameter.
5. Finish: Factory-applied primer exterior; factory-applied epoxy coating interior.

H. Pipe Supports:
1. Concrete Beams: Follow Section 03 00 05, Concrete.
2. Concrete Piers: Class I concrete; follow Section 03 00 05, Concrete.

2.7 ASPHALT PAVEMENT

A. Comply with Section 32 12 00, Flexible Paving.

2.8 PAINTING

A. Manufacturers:
1. Carboline Company.
2. ICI Paints (Devoe Coatings).
3. The Sherwin-Williams Company.
4. Tnemec Company, Inc.
5. Or as approved.

B. Materials:
1. Coatings: Ready-mixed, except field-catalyzed coatings. Process pigments to a soft paste consistency, capable of being readily and uniformly dispersed to a homogeneous coating; good flow and brushing properties; capable of drying or curing free of streaks or sags.
2. Accessory Materials: Linseed oil, shellac, turpentine, paint thinners and other materials not specifically indicated but required to achieve the finishes specified, of commercial quality. Use products compatible with painting materials and approved by paint manufacturer.

3. Paint materials and equipment shall be compatible in use.
4. Primer, Intermediate, and Finish coats shall all be from the same coatings manufacturer. Prime coats shall be compatible with and appropriate for use on surface to be coated.

C. Colors:
1. Colors will be selected by OWNER from manufacturer's standard colors.

D. Paint Systems: Paint systems of The Sherwin-Williams Company are listed. Equivalent systems of other manufacturers previously specified are acceptable.
1. Metal - Non-Submerged:
   a. Prime Coat: Recoatable Epoxy Primer B67 Series, B67V5 Hardener, 3-6 mils dft.
   b. First Coat: Hi-Solids Polyurethane B65-300 Series Color, B60V30 Hardener, 3-4 mils dft.
   c. Second Coat: Hi-Solids Polyurethane B65-300 Series Color, B60V30 Hardener, 3-4 mils dft.
2. Metal - Submerged:
   a. Prime Coat: Targuard Coal Tar Epoxy B69B60 / B69V60, 8-12 mils dft.
   b. First Coat: Targuard Coal Tar Epoxy B69B60 / B69V60, 8-12 mils dft.
3. Plastic and Fiberglass:
   a. Prime Coat: DTM Acrylic Gloss Coating B66-100 Series, 2.5-4 mils dft.
   b. First Coat: DTM Acrylic Gloss Coating B66-100 Series, 2.5-4 mils dft.
4. Concrete: Interior surfaces of the wet well shall be coated with a heavy duty, chemical resistant epoxy resin coating, suitable for raw wastewater service in accordance with coating manufacturer recommendations. Use bitumastic 300M by Carboline Company, TNEMEC Vinister Series 120-5001, or approved equal.

2.9 LANDSCAPING

A. Follow Section 32 92 00, Lawns and Meadows.

PART 3 EXECUTION

3.1 EXCAVATION AND FILL

A. Follow Section 31 23 05, Excavation and Fill.

3.2 WET WELL

A. Construct base; follow Section 03 00 05, Concrete.

B. Install wall sections plumb and level. Provide flexible plastic gasket material on the outside shoulder of all wall joints; install so as not to interfere with proper sealing of the rubber gaskets.

C. Place concrete fill in bottom of wet well.

D. Construct top slab; follow Section 03 00 05, Concrete.

E. Install pipe brace and concrete pipe support beam angle.

F. Install electrical handhole. Coat surfaces in contact with concrete with bituminous coating.

G. Install vent plumb and level.

3.3 VALVE VAULT

A. Place precast vault on original earth sub-base with a 6 inch stone leveling course, plumb and level.

B. Place concrete fill in bottom of vault and slope to sump.

C. Vent: Install plumb and level.

D. Floor Door:
   1. Comply with manufacturer's instructions.
   2. Install drain piping; follow paragraph 3.6 in this Section.

E. Install sump drain piping; follow paragraph 3.6 in this Section.

3.4 ANCHORS AND ANCHOR BOLTS

A. Use expansion anchors in precast and cast-in-place concrete.

3.5 SUBMERSIBLE PUMPS

A. Install pumps, guide assemblies, access doors, and controls; follow Section 43 21 39.13, Submersible Pumps.

3.6 PIPING

A. Examination:
   1. Verify location and elevation of wall castings and supports.
   2. Inspect linings for damage.
   3. Verify that polyethylene encasement is in place, where required, before backfilling.

B. Preparation:
   1. Clean gaskets and all surfaces in contact with gaskets; comply with manufacturer's instructions.
   2. Keep interior of pipe and fittings clean.
   3. Prepare piping connections to equipment with flanges.

C. Pipe, Fittings, Valves and Accessories:
   1. Install in accordance with manufacturer's instructions.
   2. Pipe Supports: Follow Sections 03 00 05, Concrete and as indicated on Drawings.
   3. Install wall castings in proper location and elevation before concrete and piping are in place. Boxing out of forms for later placement will not be permitted.
   4. Install bell and spigot pipe with bell end in the direction of laying the pipe.
   5. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.

6. Provide access to valves and fittings.
7. Tighten flanged joints with all bolts taking equal stress.
8. Install valves plumb and level, free from distortion and strain from misaligned piping or equipment.
9. Install polyethylene encasement for all buried ductile iron pipe, fittings, and appurtenances. Comply with AWWA C105 Method A and manufacturer's instructions. Completely tape all overlaps and seams. Repair all rips, punctures, and other damage to the polyethylene.

D. Pressure and Leakage Tests: Provide all labor and equipment and clean water to complete the following piping testing:
   1. Submersible Pump Discharge: Follow Section 40 05 05, Exposed Piping Installation.
   2. Drains: Demonstrate free to drain; correct for free drainage.

3.7 ASPHALT PAVEMENT

A. Prepare subgrade per Specification Section 31 23 05, Excavation and Fill.

B. Base Course: 8 inches thick of stabilized aggregate after compaction; two equal courses.

C. Surface Course: 2 inches of Asphaltic Concrete Surface Course (Type 1).

D. Pavement may be installed per alternate design if approved by ENGINEER.

3.8 PAINTING

A. Examination:
   1. Verify that surfaces are ready for application of materials in accordance with the product manufacturer's instructions.
   2. Examine surfaces scheduled to be finished prior to commencement of Work. Report any condition that may potentially affect proper application.
   3. Measure moisture content of surfaces using appropriate method as instructed by the coating manufacturer. Do not apply finishes unless moisture content of surfaces are below the coating manufacturer's acceptable maximums.

B. Preparation:
   1. Mask nameplates, descriptive data on pumps, motors and other equipment.
   2. Correct defects and clean surfaces which affect the Work.
   3. Seal marks which may bleed through surface finishes with sealer instructed by paint manufacturer.
   4. If mildew is encountered, remove by scrubbing with solution of tri-sodium phosphate and bleach. Rinse with clean water and allow surface to dry.
   5. Where surfaces are coated with bituminous coating that is not compatible with paint material, remove bituminous coating with abrasive blasting.
   6. Galvanized Surfaces: Remove surface contamination and oils and wash with solvent. Apply manufacturer's required primer.
   7. Uncoated Steel and Iron Surfaces:
      a. Welded areas shall be ground smooth per NACE Standard RP 0178.
      b. Use abrasives for blast cleaning that are clean, uniformly graded, and free of oil, soluble salts, chlorides, or foreign matter which could contaminate the blasted

surface. Size the abrasive to produce an anchor pattern profile height as required by the coating manufacturer.

c. Metal surfaces to be painted, and not factory-primed, shall be field-abrasive blasted in accordance with NACE-3 (SSPC-SP6), commercial blast, for non-immersion service; and in accordance with NACE-2 (SSPC-SP10), near-white blast, for immersion service, unless a higher degree of surface preparation is required by the manufacturer.

8. Shop-Primed Steel Surfaces:
   a. Remove loose primer and rust in accordance with SSPC-SP2 Hand Tool Cleaning or SSPC-SP3 Power Tool Cleaning. Feather edges to make touch-up patches inconspicuous. Clean surfaces in accordance with SSPC-SP1 Solvent Cleaning. Prime bare steel surfaces.
   b. Retouch damaged areas of shop-primed items with compatible primer.
   c. CONTRACTOR responsible for compatibility of shop primer with field-finish coats.
   d. Plastic and Fiberglass: Solvent-wipe and scuff sand; apply test sample prior to application to ensure adhesion.

C. Application:
1. Comply with manufacturer's instructions.
2. Do not thin materials, except to comply with manufacturer's instructions.
3. Apply coatings to all surfaces with special attention to hard-to-reach areas such as between the legs of back-to-back angles. Apply each coat to achieve the specified dry film thickness.
4. Do not apply finishes to surfaces that are not dry.
5. Deficiencies in film or coating thickness shall be corrected by the application of an additional coat(s) of material at the expense of CONTRACTOR.
6. Apply each coat to a uniform smooth finish.
7. Special attention shall be given to ensure that edges, corners, crevices and welds receive a film or coating thickness equivalent to that of adjacent surfaces. At no time will wet-on-wet applications be permitted. The finished surfaces shall be free from runs, drips, ridges, waves, laps, brush marks and variations in color, texture and finish.
8. Apply each coat of paint slightly darker than the preceding coat unless otherwise approved.
9. Sand surfaces lightly between coats as required to achieve required finish.
10. Vacuum clean surfaces free of loose particles. Use tack cloth just prior to applying next coat.

D. Painting Schedule:
1. Exposed piping, except not within wet well.
2. Structural steel.
3. Vents.
4. Wet well.

3.9 LANDSCAPING

A. Follow Section 32 92 00, Lawns and Meadows.

3.10 FIELD QUALITY CONTROL

A. Operational Test: Demonstrate that all pumping station equipment is electrically, mechanically, structurally, and otherwise acceptable, and that it is safe, in optimum working condition, and conforms to the specified operating conditions by supplying sufficient clear water and operating station through several pumping cycles. During operation 1) observe and record operation of pumps, discharge gage readings, amperage draw, pump controls and liquid level controls, 2) check calibration of instrumentation equipment, test manual control devices, and automatic control systems, and 3) be alert to any undue noise, vibration, or other operational problems.

END OF SECTION

SECTION 43 21 39.13

SUBMERSIBLE PUMPS

PART 1 GENERAL

1.1 DESCRIPTION

A. Scope:
   1. Provide all labor, materials, equipment, and incidentals as shown, specified, and required to furnish and install submersible pump system, complete and operational.

B. Related Sections:
   1. Section 43 21 39, Pumping Station – Submersible Type with Valve Vault.

1.2 SECTION INCLUDES

A. Submersible pumps.

B. Pump guide assemblies.

C. Pump access doors.

D. Pump controls.

E. Standby generator.

1.3 REFERENCES

A. Standards referenced in this section are:
   1. International Standards Organization (ISO), ISO 8528, Reciprocating Internal Combustion Engine Driven Alternating Current Generator Sets.
   2. ISO 9001, Quality Management Systems – Requirements.
   3. NEMA MG-1, Motors and Generators.
   4. NFPA 30, Flammable and Combustible Liquids Code.
   5. NFPA 37, Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines.
   6. NFPA 70, National Electrical Code.
   7. NFPA 70E, Electrical Safety in the Workplace.
   8. NFPA 110, Standard for Emergency and Standby Power Systems.
   9. UL 142, Steel Aboveground Tanks for Flammable and Combustible Liquids.
   10. UL 508, Safety Standard for Industrial Control Equipment.
   11. UL 2200, Standard for Safety Stationary Engine Generator Assemblies (rated 600 volts or less).

1.4 PERFORMANCE CRITERIA

A. Pumps must be designed to handle raw, unscreened, domestic sanitary sewage. Each pump shall be selected to perform under operating conditions based on, but not limited to:
   1. Capacity (GPM).
   2. Total Dynamic Head (ft).

3. Total Discharge Static Head (ft).

B. Site power furnished to pumping station shall be three phase, 60 hertz, 480 volts, four wire maintained within industry standards. Voltage tolerance shall be plus or minus 10 percent. Control voltage shall not exceed 120 volts nominal.

1.5 SUBMITTALS

A. Product Data
   1. Prior to fabrication, the project's contractor or developer's representative, shall submit three copies of the pumping station manufacturer's data for review and approval.
      a. Submittal shall include shop drawings, electrical ladder logic drawings, and support data as follows: Catalog cut sheets reflecting characteristics for major items of equipment, materials of construction, major dimensions, motor data, pump characteristic curves showing the design duty point capacity (GPM), head (ft), net positive suction head required (NPSHr), and hydraulic brake power (BHP). Electrical components used in the motor branch and liquid level control shall be fully described.
   2. Prior to fabrication, the project's contractor or developer's representative, shall submit three copies of the on-site generator manufacturer's data for review and approval.
   3. Prior to fabrication, the project's contractor or developer's representative, shall submit three copies of the SCADA system manufacturer's data for review and approval. The submittal data shall include, but not limited to, the RTU Communication's Study.

B. Operations and Maintenance Manuals
   1. Installation shall be in accordance with written instruction provided by the pumping station manufacturer. Comprehensive instructions supplied at time of shipment shall enable personnel to properly operate and maintain all equipment supplied. Content and instructions shall assume operating personnel are familiar with pumps, motors, piping and valves, but lack experience on exact equipment supplied.
   2. Electrical Documentation shall be specific to the pumping station and collated in functional sections. Each section shall combine to form a complete system manual covering all aspects of equipment supplied by the station manufacturer. Support data for any equipment supplied by others, even if mounted or included in overall station design, shall be provided by those supplying the equipment. Instructions shall include the following as a minimum:
      a. Functional description of each major component, complete with operating instructions.
      b. Instructions for operating pumps and pump controls in all modes of operation.
      c. Calibration and adjustment of equipment for initial start-up, replacement of level control components, or as required for routine maintenance.
      d. Support data for commercially available components not produced by the station manufacturer, but supplied in accordance with the specifications, shall be supported by literature from the prime manufacturer and incorporated as appendices.
      e. Schematic diagram of the pump station circuits shall be in accordance with NMTBA and JIC standards. Schematics shall illustrate, to the extent of authorized repair, pump motor branch, control and alarm system circuits including interconnections. Wire numbers and legend symbols shall be shown. Schematic diagrams for individual components, not normally repairable by the station

operator, need not to be included. Details for such parts shall not be substituted for an overall system schematic. Partial schematics, block diagrams, and simplified schematics shall not be provided in lieu of an overall system diagram.

f. Mechanical layout drawing of the pumping station and components, prepared in accordance with good commercial practice, shall provide installation dimensions and location of all pumps, motors, valves and piping.

3. Operation and maintenance instructions, which rely on vendor cut-sheets and literature, which include general configurations, or require operating personnel to selectively read portions of the manual shall not be acceptable. Operation and maintenance instructions must be specific to equipment supplied in accordance with these specifications.

1.6 QUALITY ASSURANCE

A. Upon request from the Engineer, the pumping station manufacturer shall prove financial stability and ability to produce the station within the specified delivery schedules. Evidence of facilities, equipment, and expertise shall demonstrate the manufacturer's commitment to long term customer service and product support.

B. The pumps shall be heavy duty, electric submersible centrifugal non-clog units designed for handling raw, unscreened sewage and wastewater. The pumps shall be capable of pumping a 3.0" spherical solid.

C. The pumps provided shall be capable of operating in an ambient liquid temperature of 104° F as specified by the National Electrical Manufacturers Association (NEMA) and Factory Mutual (FM).

D. The pump and motor unit shall be suitable for continuous operation at full nameplate load while the motor is completely submerged, partially submerged or totally non-submerged. The use of shower systems, secondary pumps or cooling fans to cool the motor shall not be acceptable.

E. The pump, mechanical seals and motor unit provided under this specification shall be from the same manufacturer in order to achieve standardization of operation, maintenance, spare parts, manufacturer's service and warranty.

F. The manufacturer's technical representative shall inspect the completed installation, correct or supervise the correction of any defect or malfunction, and instruct operating personnel in the proper operation and maintenance of the equipment.

1.7 MANUFACTURER'S WARRANTY

A. The pumping station manufacturer shall warrant all equipment to be of quality construction, free of defects in material and workmanship. A written warranty shall include specific details described below:

1. All equipment, apparatus, and parts furnished shall be warranted for one year, excepting only those items normally consumed in service, such as light bulbs, oils, grease, packing, gaskets, O-rings, etc. The pumping station manufacturer shall be solely responsible for warranty of the station and all components.

2. The pump shaft seal shall be warranted for a minimum of four years from date of shipment. Should the seal fail within the first year, the manufacturer shall furnish a new seal, without charge to the Owner, F.O.B factory. The warranty replacement cost for seals after the first year will be pro-rated as follows:

Failure Within	Percent New Price
2 Years	25%
3 Years	50%
4 Years	75%

3. Components failing to perform as specified by the Engineer, or as represented by the manufacturer, or as proven defective in service during the warranty period, shall be replaced, repaired, or satisfactorily modified by the manufacturer without cost of parts or labor to the Owner.

B. The warranty provided by the CONTRACTOR to the County shall become effective upon the issuance of a Permit to Operate by the SC DHEC.

1.8 UNITARY RESPONSIBILITY

A. In order to unify responsibility for proper operation of the complete pumping station, it is the intent of these specifications that all system components be furnished by a single supplier (unitary source) approved by the County. The pumping station must be of standard catalog design, totally warranted by the manufacturer. Under no circumstances will a system consisting of parts compiled and assembled by a manufacturer's representative or distributor be accepted.

1.9 DELIVERY, STORAGE AND HANDLING

A. Delivery:
1. Cover all generator air and exhaust openings with vapor inhibiting and water repellent material.
2. Deliver anchorage devices that are to be embedded in cast-in-place concrete in ample time to prevent delaying the Work.
3. Inspect equipment for shipping damage or loose parts upon delivery. Check for evidence of water that may have entered equipment during transit.
4. Notify ENGINEER of loss or damage to equipment or components. Replace loss and repair damage to new condition in accordance with manufacturer's instructions.

B. Handle equipment in accordance with manufacturer's instructions. Furnish at least one copy of instructions with equipment at time of shipment.

C. Storage:
1. Store equipment in a clean, dry location with controls for uniform temperature and humidity. Protect equipment with coverings and maintain environmental controls.
2. Store materials for easy access for inspection and identification. Keep all materials off the ground, using pallets, platforms or other supports. Protect equipment from corrosion and deterioration.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Provide pumps and appurtenances as manufactured by Xylem Flygt Company.

2.2 SUBMERSIBLE PUMPS

A. Unit Base:
   1. The unit base shall comprise of a base plate, perimeter flange, and reinforcements. Base plate shall be fabricated of steel not less than 3-inch thick, and shall incorporate openings for access to all internal cavities to permit complete grouting of unit base after installation. Perimeter flange and reinforcements shall be designed to prevent flexing or warping under operating conditions. Base plate and/or flange shall be drilled for hardware used to secure unit base to concrete pad as shown on the contract drawings. Unit base shall contain provisions for lifting the complete pump unit during shipping and installation.

B. Pump Design:
   1. The pumps shall be automatically and firmly connected to the discharge connection, guided by no less than two guide bars extending from the top of the station to the discharge connection. There should be no need for personnel to enter the wet-well.
   2. Sealing of the pumping unit to the discharge connection shall be accomplished by a machined metal to metal watertight contact.

C. Pump Construction:
   1. Major pump components shall be of gray cast iron, ASTM-48, Class 35B, with smooth surfaces devoid of blow holes or other irregularities.
   2. All exposed nuts or bolts shall be AISI type 304 stainless steel construction. All metal surfaces coming into contact with the pumpage, other than stainless steel or brass, shall be protected by a factory applied spray coating of acrylic dispersion zinc phosphate primer with a polyester resin paint finish on the exterior of the pump.
   3. Critical mating surfaces where watertight sealing is required shall be machined and fitted with Nitrile or Viton rubber O-rings. Fittings will be the result of controlled compression of rubber O-rings in two planes and O-ring contact of four sides without the requirement of a specific torque limit.
   4. The cable entry shall consist of a single cylindrical elastomer grommet, flanked by washers, all having a close tolerance fit against the cable outside diameter and the entry inside diameter and compressed by the body containing a strain relief function, separate from the function of sealing the cable.

D. Impeller:
   1. The impeller shall be semi-open, high efficiency multi-vane design with back swept non-clog design. Impeller material shall be 25% High Chrome Iron (ASTM A-532) (Alloy III A). The leading edge of the semi-open impeller shall be hardened to Rc60 or 650Brinell. It shall be balanced to ISO1940 Grade G6.3.
   2. Enclosed impeller shall be of gray cast iron, Class 35B, dynamically balanced to ISO1940 Grade G6.3, double shrouded non-clogging design having a long through-let

with out acute turns. Enclosed impeller shall be supplied with wear ring system to provide sufficient sealing between the volute and suction inlet.
3. The impeller shall be capable of handling 3-inch spherical solids, fibrous materials, heavy sludge and other matter found in wastewater.
4. Enclosed impellers shall be coated with acrylic dispersion zinc phosphate primer.

E. Motor
1. The pump motor shall be induction type with a squirrel cage rotor, shell type design, housed in an air filled, watertight chamber, NEMA B type.
2. The stator windings and stator leads shall be insulated with moisture resistant Class H insulation rated for 180° C (356° F). The stator shall be dipped and baked three times or use trickle impregnation method to achieve Class H insulation and shall be heat-shrink fitted in to the stator housing.
3. The motor shall be designed for continuous duty handling pumped media of 40° C (104° F) and capable of up to 15 evenly spaced starts per hour.
4. The motor and pump shall be designed and assembled by the same manufacturer.
5. The motor horsepower shall be adequate so that the pump is non-overloading throughout the entire pump performance curve from shut-off through run-out.

F. Data Plate: Fabricate data plate from corrosion-resistant metal and mechanically attach to pump. Engrave the plate with the following:
1. Manufacturer's name.
2. Pump size.
3. Serial number.
4. Motor horsepower, speed, and electrical information.
5. Impeller diameter.
6. Capacity and head.

2.3 PUMP GUIDE ASSEMBLIES

A. Pump guide assembly to consist of either guide rails, a self-aligning sliding bracket, upper guide bracket, intermediate guide brackets (as required by manufacturer), lifting chain, and discharge elbow.
1. Guide Rails and Guide Brackets: Type 304 stainless steel; rails designed to mount directly to discharge elbow at the floor and to the upper guide bracket at the top. Provide intermediate guide brackets for rail lengths over 15 feet.
2. Self-Aligning Sliding Bracket: Mounted on pump discharge with a machined mating flange which matches the discharge elbow. Sealing of the discharge connection is accomplished by a simple linear downward motion of the pump, culminating with the entire weight of the pumping unit supported entirely by the discharge elbow.
3. Lifting Rope: Stainless steel cable of sufficient length to extend from the pump in the lowest position in the wet well to the connection at the top of the wet well. Provide a device at the top of the wet well to attach the cable to when not in use. Size cable according to pump weight. Coordinate upper cable end terminating device with requirements for connecting to Owner's lifting equipment.
4. Discharge Elbow: Gray cast iron, ASTM A48, Class 30, designed to mount directly to wet well floor and to anchor and align guide rails with ANSI B16.1, Class 125 flange and a machined mating surface such that the pump to discharge connection is made without the need for nuts or bolts.

2.4 PUMP ACCESS DOORS

A. Load Rating: AASHTO H-20 wheel loading.

B. Frame:
   1. Material: Extruded aluminum sections shaped to serve as a continuous drainage gutter with a 1-1/2-inch drain coupling.
   2. Anchors: Continuous anchor flange.
   3. Apply manufacturer's standard protective coating to surfaces of frame that will be in contact with concrete.

C. Cover:
   1. Material: 1/4-inch mill finish aluminum diamond plate, reinforced with stiffening ribs.
   2. Hinges: Stainless steel; butt type with compression spring operators enclosed in telescopic tubes.
   3. Hold Open Arm: Stainless steel; automatically locks door at 90-degree position; provide vinyl grip handle to release door for closing.
   4. Lock: Stainless steel; slam type with fixed handle inside and removable key wrench outside.
   5. Protective Grating: Aluminum protective grating panel shall be a minimum of 3 inch (76mm) aluminum "I" bar grating with Safety Orange powder-coated finish. Grating shall be hinged with tamper proof stainless steel bolts, and shall be supplied with a positive latch to maintain unit in an upright position. Grating shall have a 6-in. (152mm) viewing area on each lateral unhinged side for visual observation and limited maintenance. A padlock hasp for owner-supplied padlock shall be provided.

D. Hardware and Fasteners: Type 316 stainless steel.

E. Accessories: Provide one key wrench for each door supplied.

2.5 PUMP CONTROLS

A. Control Panel:
   1. Electrical control equipment shall be mounted within a NEMA 4X stainless steel, dead front type, control enclosure. Door shall be hinged and sealed with a neoprene gasket and equipped with captive closing hardware. Control components shall be mounted on a removable steel back panel secured to enclosure with collar studs. All control devices and instruments shall be mounted using threaded fasteners, and shall be clearly labeled to indicate function.
   2. Front panel mounted devices shall be rated NEMA 4X and shall not compromise the NEMA 4X panel rating.
   3. Pump station controls shall conform to third party safety certification. The enclosure and all components mounted on the subpanel or control cover shall conform to UL descriptions and procedures. Control panel assembly panel shall be constructed in conformance with UL 508 and bear the UL seal confirming the construction.
   4. Control panel components to be of highest industrial quality, secured to the back panel with machine screws and lock washers. Mounting holes shall be drilled and tapped; Self- tapping screws shall not be used to mount any component.
   5. A properly sized heavy-duty circuit breaker, with a minimum RMS interrupting rating of 14,000 amperes at 460 volts, shall be furnished for each pump motor. The circuit

breakers must be sealed by the manufacturer after calibration to prevent tampering. An operating mechanism installed on each motor circuit breaker shall penetrate the control panel door. A pad-lockable operator handle shall be secured on the exterior surface. Mechanical interlocks must prevent opening the door until circuit breakers are in the "OFF" position.

6. An open frame, across-the-line, NEMA rated magnetic starter with under-voltage release, and overload protection on all three phases, shall be furnished for each pump motor. Starters of NEMA size 1 and above shall allow addition of at least two auxiliary contacts. Starters rated "0", "00", or fractional sizes are not acceptable. Power contacts to be double-break type made of cadmium oxide silver. Coils to be epoxy molded for protection from moisture and corrosive atmospheres. Contacts and coils to be easily replaceable without removing the starter from its mounted position. Each starter shall have a metal mounting plate for durability. Overload relays to be block-type with melting alloy spindles, having visual trip indication with trip free operation. Pressing the overload-reset lever shall not actuate the control contact until after the overload spindle has reset. Resetting the overload reset lever will cause a snap-action control and not convertible to automatic reset. Trip settings shall be governed by the heater element only, and not by adjustable settings. Heater elements must provide NEMA Class 20 trip times, selected in accordance with actual motor nameplate data. An overload-reset pushbutton, mounted through the control panel door, shall permit resetting the overload relays without opening the control panel door.
7. The control panel shall be equipped with a secondary lightning arrestor to minimize damage to the pump motors and control from transient voltage surges. The arrestor shall utilize silicon-oxide varistors encapsulated in a non-conductive housing. The arrestor shall have a current rating of 60,000 Amps, a Joule rating of 1500.
8. The control panel shall be equipped to monitor the incoming power and shut down the pump motors when required to protect the motor(s) from damage caused by phase reversal, phase loss, low voltage, and voltage unbalance. An integral time delay shall be provided to minimize nuisance trips. The motor(s) shall automatically restart when power conditions return to normal.
9. Control Circuits
    a. A normal duty thermal-magnetic circuit breaker shall protect all control circuits by interrupting control power.
    b. Pump mode selector switches shall permit manual start or stop of each pump set individually, or permit automatic operation under control of the liquid level control system. Manual operation shall override all shutdown systems, except the motor overload relays. Selector switches to be heavy duty, oil-tight design with contacts rated NEMA A300 minimum.
    c. Pump alternator relay to be electro-mechanical industrial design. Relay contacts to be rated 10 amperes minimum at 120 volts non-inductive. A switch shall permit the station operator to select automatic alteration of pumps, to select pump set number one to be "lead" for each pumping cycle, or to select pump set number two to be "lead" pump for each pumping cycle.
    d. Six-digit elapsed time meter (non-reset type) shall be provided for each pump set to indicate total running time of each pump set in "hours" and "tenths of hours." A pilot light shall be wired in parallel to indicate that the motor is energized and should be running.
    e. A high pump temperature protection circuit shall override the level control and shutdown the pump motor(s) when required to protect the pump from excessive temperature. A thermostat shall be mounted on each pump casing and connected

to a high pump temperature shutdown circuit. If casing temperature rises to a level sufficient to cause damage, the thermostat causes the pump shutdown circuit to interrupt power to the motor. A visible indicator located on the control panel door shall indicate motor stopped due to high pump temperature. The motor shall remain locked out until the pump has cooled and circuit has been manually reset. Automatic reset of the circuit is not acceptable.

f. A duplex ground fault receptacle providing 115 VAC, 60 Hz, single phase current, will be mounted on the side of the control enclosure. Receptacle circuit shall be protected by a 15-ampere thermal-magnetic circuit breaker.

2.6 AUXILIARY POWER TRANSFORMER CONTROLS AND ACCESSORIES

A. The lift station shall be equipped with a 3 KVA step-down transformer to supply 115-volt, AC, Single phase for the control and auxiliary equipment. The primary and secondary side of the transformer are to be protected by a thermal magnetic circuit breaker sized to meet the power requirements of the transformer. An operating mechanism shall penetrate the control panel door, and a padlockable operator handle shall be secured on the exterior surface. Interlocks must prevent opening the door until circuit breakers are in “OFF” position.

B. All wiring, workmanship, and schematic wiring diagrams shall comply with Applicable standards and specifications of the National Electric Code (NEC). All user serviceable wiring shall be type MTW or THW, 600 volts, color coded as follows:

1.	Line and Load Circuits, AC or DC power	Black
2.	AC Control Circuit Less Than Line Voltage	Red
3.	DC Control Circuit	Blue
4.	Interlock Control Circuit from external source	Yellow
5.	Equipment Grounding Conductor	Green
6.	Current Carrying Ground	White
7.	How With Circuit Breaker Open	Orange

C. Control circuit wiring inside the panel, with exception of internal wiring of individual components, shall be 16-gauge minimum, type MTW or THW, 600 volts. Power wiring to be 14-gauge minimum. Motor branch wiring shall be 10-gauge minimum. Motor branch and other power conductors shall not be loaded above 60 degrees Celsius temperature rating, on circuits of 100 amperes or less, nor above 75 degrees Celsius on circuits over 100 amperes. Wires must be clearly numbered at each end in conformance with applicable standards. All wire connectors in the control panel shall be ring tongue type with nylon-insulated shanks. All wires on the back panel shall be bundled and tied. All wires extending from components mounted on door shall terminate at a terminal block mounted on the back panel.

D. All wiring outside the panel shall be routed through conduit. Control wires connected to door mounted components must be tied and bundled in accordance with good commercial practice. Bundles shall be made flexible at the hinged side of the enclosure. Adequate length and flex shall allow the door to swing full open without undue stress or abrasion. Bundles shall be held on each side of hinge by mechanical fastening devices. Factory installed conduit shall conform to following requirements:

1. All conduit and fittings to be UL listed.

2. Use PVC-coated rigid steel for exterior conduit runs in hazardous, wet, and corrosive locations.
3. Use PVC-coated rigid steel conduit for individual conduits direct buried in the ground.
4. Liquid tight flexible metal conduit to be constructed of smooth, flexible galvanized steel core with smooth abrasion resistant, liquid tight polyvinyl chloride cover.
5. Conduit to be supported in accordance with articles 344 and 350 of the National Electric Code.
6. Conduit shall be sized according to the National Electric Code.

E. Station manufacturer shall ground all electrical equipment inside the pump station to the panel powering the equipment. The CONTRACTOR shall provide a minimum of one earth driven ground rod connection at the service entrance equipment in accordance with the National Electric Code (NEC) and local requirements.

F. Permanent corrosion resistant name plate(s) shall be attached to the control and include following information:
1. Equipment serial number
2. Supply voltage, phase and frequency
3. Current rating of the minimum main conductor
4. Electrical wiring diagram number
5. Motor horsepower and full load current
6. Motor overload heater element
7. Motor circuit breaker trip current rating
8. Name and location of equipment manufacturer

G. Control components shall be permanently marked using the same identification keys shown on the electrical diagram. Labels shall be mounted adjacent to device being identified. Switches indicators, and instruments mounted through the control panel door shall be labeled to indicate function, position, etc. Labels shall be mounted adjacent to, or above the device.

H. Liquid Level Monitoring and Control
1. The level monitoring and control system shall start and stop the pump motors in response to changes in wet well level, as set forth herein.
2. The level monitoring and control system shall be capable of operating as a conductivity probe-type system for liquid level control and with a float-ball system for high and low level alarms, as manufactured by ITT Flygt, DEVAR Inc., or manufacturer approved equal by York County.
3. The level control system shall utilize the alternator relay to select first one pump set, then the second pump set, to run as lead pump for a pumping cycle. Alternation shall occur at the end of a pumping cycle.
4. The level control system shall be provided with pump start and stop delays to prevent simultaneous motor starts and to reduce the potential of hydraulic surges during motor shutdown. Motor starts shall also be sequenced to provide step loads on the generator.
5. The level control system shall utilize the conductivity probe-type system which shall continuously, monitor the wet well level, permitting the operator to read wet well level at any time. Upon operator selection of automatic operation, the conductivity probe-type system shall start the motor for one pump set when the liquid level in the wet well rises to the “lead pump start level”. When the liquid is lowered to the “lead pump stop level”, the conductivity probe-type system shall stop these pumps. These actions shall

constitute one pumping cycle. Should the wet well level continue to rise, the conductivity probe-type system shall start the second pump set when the liquid reaches the “lag pump start level” so that all pumps are operating. These levels shall be adjustable as described below.

6. The conductivity probe-type system shall include integral components to perform all pressure sensing, signal conditioning. EMI and RFI suppression. DC power supply and 120 volt outputs. Components shall be solid state and shall be integrated with other components to perform as described below.
7. The conductivity probe-type system shall be capable of operating on a supply voltage of 108 volts to 132 volts AC, 60 hertz, in an ambient temperature range of –10 degrees Celsius (14 degrees Fahrenheit) through +55 degrees Celsius (131 degrees Fahrenheit). Control range shall be 0 to -----.0 feet of water with an overall repeat accuracy of (plus/minus) 0.1 feet of water. Memory shall be retained using a non-volatile lithium battery backup.
8. The conductivity probe-type system shall consist of the following integral components: display, output relays:
    a. The conductivity probe-type system shall incorporate a digital back-lighted LCD panel display which, upon operator selection, shall indicate liquid level in the wet-well, and the preset start and stop level for both lead and lag pump. The display shall include 20, 0.19 inch high alphanumeric characters calibrated to read out directly in feet of water, accurate to within one-tenth foot (0.1 foot), with a full-scale indication of not less than 12 feet. The display shall be easily convertible to indicate English or metric units.
    b. Level adjustments shall be electronic comparator set points to control the levels at which the lead and lag pumps start and stop. Each of the level settings shall be adjustable and accessible to the operator without opening the cover panel. Controls shall be provided to permit the operator to read the selected levels on the display. Such adjustments shall not require hard wiring, the use of electronic test equipment, artificial level simulation.
    c. An alarm silence pushbutton and relay shall be provided to permit maintenance personnel to de-energize the audible alarm device while corrective actions are under way. After silencing the alarm device, manual reset of the alarm condition shall clear the alarm silence relay automatically. The pushbutton shall be oil tight design with contacts rated NEMA A300 minimum.
    d. Station manufacturer will supply one 115-volt AC alarm light fixture with vapor-tight red glove, guard, conduit box, and mounting base. The design must prevent rain water from collecting in the gasketed area of the fixture, between the base and globe. The alarm light will be shipped loose for installation by the CONTRACTOR.
    e. Station manufacturer will supply one 115-volt AC weatherproof alarm horn with projector, conduit box, and mounting base. The design must prevent rainwater from collecting in any part of the horn. The alarm horn will be shipped loose for installation by the CONTRACTOR.

2.7 TELEMETRY

A. Each pump station shall be supplied with a Supervisory Control and Data Acquisition (SCADA) Remote Terminal Unit (RTU). The work to be accomplished under this specification shall consist of furnishing the equipment necessary for modifying the existing automatic control and monitoring system. The equipment shall be designed, fabricated, programmed, tested, started-up, and warranted by a single supplier.

2.8 ON-SITE GENERATOR SYSTEM

A. General:
   1. All pump stations shall have an automatic standby power generation system conforming to these specifications.
   2. The system shall consist of a diesel-fueled standby generator in a weatherproof enclosure complete with all equipment and accessories required to automatically supply power to the pump station during a utility power failure.

> As an alternate to a diesel-fueled standby generator, the County may request the use of a natural gas fueled standby generator. The natural gas fueled standby generator shall meet all the following requirements as appropriate for a natural gas fueled engine.

B. Engine:

1. Engine block material	Cast Iron
2. Cylinder head material	Cast Iron
3. Crankshaft material	Hardened Steel
4. Pistons	Aluminum Alloy
5. Valve seats	Replaceable
6. Maximum Rated RPM	1800

C. Engine Governor:

1. Type	Mechanical
2. No-load to full load frequency regulation	5.0%
3. Steady state regulation	+/-0.33%
4. Overspeed shutdown	Automatic solid state

D. Engine Lubrication System:

1. Oil pump	Gear type
2. Oil filter	Full flow, cartridge
3. Low oil pressure shutdown	Automatic

E. Engine Cooling System:

1. Type of system	Pressurized, closed recovery
2. High temperature shutdown	Automatic
3. Low coolant level shutdown	Automatic
4. Fan	Pusher type with guard
5. Engine block heater	1,000 watts (min), 120 VAC, thermostatically controlled
6. Coolant	Water/ethylene glycol (-34° protection)

F. Engine Fuel System:

1. Fuel	#2 Diesel
2. Fuel filter	5 micron
3. Injection type	Direct
4. Fuel pump	Mechanical, engine driven
5. Fuel tank	integral, UL listed, double-walled, steel fuel storage
6. Fuel tank capacity	24 (min.) hours @ rated load

7. Fuel tank accessories — Fuel level indicator
8. Low fuel indicator switch (on at 20% capacity), Screened vent for double wall cavity, Drain port

G. Engine Exhaust System:
1. Silencer — Critical
2. Mounting — External with weather cap
3. Connection — Flexible stainless steel pipe

H. Engine Combustion Air Intake:
1. Air cleaner — Replaceable dry cartridge

I. Engine Electrical:
1. Starter motor — 12 or 24 volt
2. Battery charge alternator — 30 amps (min)
3. Crank limiter — Solid state
4. Battery — 2 - 12 volt (series or parallel, as appropriate)
5. Battery mounting — Rack inside enclosure
6. Polarity — Negative ground
7. Standby charger — 10 amp, automatic float

J. Generator:
1. The generator shall meet the following requirements:
   a. Generator Specifications**:**
      1) Generator type — 4 pole, revolving field
      2) Output — 12 lead, reconnectable
      3) Stator — "Skewed" design
      4) Housing — Drip proof design, self-ventilated
      5) Rotor insulation — Class F
      6) Stator insulation — Class F
      7) Bearings — Sealed, pre-lubed
      8) Engine coupling — Direct, flexible disc
      9) Protection — Output circuit breaker (manual reset)
   b. Excitation:
      1) Exciter type — Brushless
      2) Protection — Manual circuit breaker
   c. Regulation:
      1) Type — Solid state
      2) Regulation — +/-2% steady state
      3) Voltage adjustment — 5% - manual rheostat

K. Generator Set Controls
1. The engine-generator set shall be equipped with a control panel having the following features:
   a. Engine Controls & Indicators:
      1) Engine Gauges: — Oil pressure
         Coolant temperature
         Battery charging ammeter
      2) Annunciator: — Low oil pressure shutdown
         High temperature/low coolant

	level shutdown
	Overcrank shutdown
	Overspeed shutdown
	Low fuel
3) Engine hour meter	99,999.0 hour
4) Remote engine hour meter located at transfer switch	99,999.0 hour
5) Engine control switch	Off/Manual/Automatic

L. Generator Controls & Indicators:

1. Gauges	AC frequency
	Output voltage
	Output current
2. Gauge Selector switch	3 position with "off"
3. Manual voltage adjustment	Rheostat, 5% adj. range

M. Alarm Output Contacts
1. Generator Fail
2. Generator Operating
3. Low Fuel
4. Alarm output contacts are to be wired to the local monitoring RTU.

N. Generator Set Enclosure & Mounting
1. The engine-generator set shall be enclosed in a weatherproof housing which meets the following specifications:

a. Access panels	Lockable (keyed alike), hinged and removable
b. Hardware	Stainless steel
c. Finish	Baked enamel over zinc coated steel
d. Mounting	Welded steel base with vibration isolators
e. Mounting location	Top of fuel tank

O. Automatic Transfer Switch:
1. The automatic transfer switch to be supplied as part of the standby power system shall meet all applicable requirements set forth by the National Electrical Code and OSHA. The transfer switch shall also conform to the requirements as specified below:

a. Enclosure:	
1) Mounting type	Surface
2) Enclosure type	NEMA 3R, lockable
b. Electrical Ratings:	
1) Operating voltage	Compatible with station voltage
2) Operating current	No less than main disconnect
3) Withstand and closing rating	10,000 Amps, RMS, Symm. (min.)
4) Normal input connection	Service entrance rated
c. Transfer Switch:	
1) Operating mechanism	Single solenoid
2) Holding mechanism	Mechanical
3) Interlock	Mechanical and electrical
4) Contact material	Silver alloy
5) Neutral delay	0.1 – 10 sec.

d. Timer Setting Ranges:

1)	Utility dropout	70-95%
2)	Utility pick-up	70-95%
3)	Utility interrupt delay	0.1 – 10 sec.
4)	Engine min. run	5 – 30 min.
5)	Engine warm-up	5 – 180 sec.
6)	Return to utility delay	1 – 30 min.
7)	Engine cool-down	1 – 30 min.
8)	Standby voltage	70 – 90%
9)	Standby frequency	80 – 90%
10)	Exerciser	Once/week

e. Operation Selectors:

1)	Exercise	With/Without load
2)	Engine warm-up bypass	On/Off
3)	Neutral delay	On/Off
4)	Mode selector	Manual Test/Standby/Off

P. Standby Power System Capacity:

1. The standby power system shall be capable of providing continuous standby power for the wastewater pumping station. The generator set shall be capable of starting the two pump motor loads sequentially with the full miscellaneous load applied, with no more than 30% dip. **The *minimum* acceptable generator set rating shall be 25 KW for any station.** The CONTRACTOR shall coordinate the starting requirements of the exact pumps being furnished on the project with the generator set supplier to ensure the generator set has adequate motor starting capability.

Q. Installation:

1. The generator set shall be mounted and anchored to a reinforced concrete pad, located to provide adequate access for fueling and servicing. The exact dimensions of the pad, conduit entries and anchor bolts shall be based on the manufacturer's shop drawings. The pad shall have outer dimensions 1 foot greater than the footprint of the base tank, to provide 6 inch of exposure on all sides. The minimum thickness of the pad shall be 12 inch, with a single mat of #6 rebar, 12 inch OCEW and located in the lower third of the concrete thickness. The weight of the mounting pad shall be equal to or greater than the weight of the generator set. All exposed edges shall be chamfered or rounded with an edging tool.

R. Field Tests:

1. The CONTRACTOR shall provide start-up and testing services utilizing personnel specifically authorized to perform such services by the standby power system manufacturer. The start-up services shall be scheduled with the COUNTY with no less than three days notice. The start-up and testing service shall include a complete inspection of the installation, initial break-in of the engine, testing the system performance, and servicing the engine. The following tests shall be performed in the presence of the COUNTY or its representative:
   a. Generator output voltage unloaded and loaded, each phase, based on 2-hour load bank test.
   b. Voltage dip as loads are applied.
   c. Complete operating sequence (simulated utility power failure and restoration).
   d. Pressure test engine cooling system for leaks.

e. Test battery charging systems.
f. Test operation of all safety systems.
g. Upon completion of break-in and testing, the engine shall be serviced as follows:
1) Change engine oil and filter.
2) Verify anti-freeze protection (-34° F).
3) Refill fuel tank (tank shall be left full).
4) Check belt tension.
5) Check battery connections and state of charge.

2. During this start-up period, the COUNTY'S maintenance personnel shall be fully instructed in the proper maintenance of the standby power system.
3. All equipment and supplies for testing and service shall be provided by the CONTRACTOR.

S. Manufacturer:
1. The generator set, controls, and transfer switch shall be furnished by a single supplier. The generator set and accessory equipment shall be supplied by Caterpillar/Olympian, Onan/Cummings, Kohler, or approved equal.
2. The supplier shall be the authorized dealer of the engine-generator set manufacturer, and shall be fully qualified and authorized to provide service and parts for the engine and generator at any time during the day or night. Parts and service shall be available 24 hours per day 7 days a week, from a location within a 100-mile radius of the location of the installed generator set.

T. Shop Drawings:
1. Prior to purchase of stand-by power generation equipment, the CONTRACTOR shall submit not less than four (5) sets of data to the County Representative for approval, including equipment data, accessories, sizing calculations, etc., as may be appropriate to determine compliance with these Specifications.

U. Operating Instructions:
1. Six (6) complete copies of operating instructions and parts list shall be provided prior to acceptance of the unit. Parts list shall include schedule of type and quantity of parts recommended for stock.

V. Spare Parts:
1. The following spare parts shall be furnished:
a. Engine Fan & Accessory Drive Belts 1 sets
b. Oil, Fuel & Air Filters 2 sets
c. Spare Indicator Lamps & Fuses of each type used 2 sets
2. Spare parts shall be boxed and labeled with the pumping station identification.

W. Warranty:
1. The complete standby power generating system shall be warranted for one year after the acceptance of the sewer pump station by the COUNTY. The warranty shall cover all defects in equipment, parts, assembly and installation. The warranty shall be issued in writing by the supplier and delivered to the COUNTY Representative.

2.9 FACTORY INSPECTION

A. Perform motor and cable insulation test for moisture content and insulation defects.

B. Run pump dry to check for proper rotation and mechanical integrity.

C. Run pump submerged for 30 minutes in water.

D. Remove pump from water; perform motor and cable insulation test.

E. A written report on the above shall be prepared by the test engineer, certified and submitted to ENGINEER.

2.10 FACTORY PERFORMANCE TEST

A. Test each pump at the factory; submit certified performance curves to ENGINEER prior to shipment.

B. Test each pump at no less than three head conditions including shut-off head and design head.

C. Provide a standard NPSH curve based on testing of standard test pump.

2.11 SPARE PARTS

A. One spare fuse for each fuse in pump control panel.

B. One spare pilot light for each pilot light in pump control panel.

C. One spare float switch with length of integral cord sufficient to replace longest provided.

PART 3 EXECUTION

3.1 INSTALLATION

A. Comply with manufacturer's instructions.

B. Float Switches:
   1. Install float switches at elevations indicated.
   2. Install stainless steel cable and anchor assembly so that anchor freely hangs within 6 inches of well bottom, and so that float switches will be easily accessible for cleaning and replacement.
   3. Attach float switch cord to cable with nylon wire ties spaced 12 inches apart and starting 6 to 8 inches above top of switch.
   4. Terminate float wiring using normally open or normally closed configuration as required for proper operation. Cap the unused third wire in the junction box.

3.2 MANUFACTURER'S START-UP SERVICES

A. Provide a minimum of one 8-hour day of service.

Widening of US 21 Bypass and SC 51 From Springfield Parkway to the NC Line
Fort Mill, York County, South Carolina
S&ME Project No. 1351-12-037

Dear Mr. Mastillone:

The purpose of this final roadway geotechnical engineering report (RGER) is to provide information that may be used in design of the roadway embankments associated with the widening of US 21 Bypass and SC 51 from Springfield Parkway to the North Carolina Line in Fort Mill, York County, South Carolina. Our services were performed in general accordance with the subcontract between STV, Inc. (STV) and S&ME, Inc. dated November 27, 2012, and subsequent Amendment 1, dated April 2014. This includes the associated scope of services for geotechnical investigations performed in general accordance with the SCDOT GDM 2010 version. The recommendations provided herein are in general accordance with the SCDOT Geotechnical Design Manual (GDM), Version 2.0, 2019 version. The recommendations of the report incorporate the engineering analyses conducted by our firm to the present time. The recommendations herein exclude the culverts and pavements which were addressed under separate cover.

We look forward to continuing our geotechnical engineering services on this important project. Please do not hesitate to contact us if you have questions or if we may be of any further assistance.

Sincerely,

S&ME, Inc.

1.0 Introduction

This report summarizes the results of the geotechnical investigation conducted to date for the widening of US 21 Bypass and SC 51 from Springfield Parkway to the North Carolina Line. The project is located in Fort Mill, York County, South Carolina, as shown on the Site Plan attached as Figure 1 in Appendix I. The field work was performed in accordance with the 2010 GDM (current at the time); however, the recommendations/reporting presented in this Final Roadway Geotechnical Report (RGER) have been prepared in accordance with the 2019 GDM and includes final design recommendations.

The RGER applies to the design and construction of the roadway embankments and roadway at grade. The culverts design recommendations are included in Appendix VI of this report. The pavement design recommendations were submitted under separate cover. S&ME's scope of work relevant to the roadway embankment portion of the project included:

- Visits to the site by geotechnical personnel.
- Coordinating field exploration activities.
- Performing geotechnical and geophysical subsurface investigations.
- Conducting laboratory testing.
- Reviewing available geologic and geotechnical-related data.
- Conducting geotechnical analyses to assess the encountered subsurface conditions as they relate to their support for the planned roadway embankment regarding slope stability and settlement.
- Preparing this report (RGER) which presents the results of our analyses and our geotechnical recommendations for the planned roadway embankments.

Project design parameters and computations generally follow those described in the relevant sections of the 2019 South Carolina Department of Transportation (SCDOT) Geotechnical Design Manual v2.0 (GDM), except where specifically described otherwise in the report text.

2.0 Project Description

2.1 Existing Conditions

2.1.1 US 21

From Springfield Parkway heading north to Lakes Boulevard, US 21 roadway consists of one (1), roughly twelve (12) foot wide northbound travel lane and one (1), roughly twelve (12) foot wide southbound travel lane. US 21 continues northward, turning into two (2), roughly twelve (12) foot wide northbound travel lanes and two (2), roughly twelve (12) foot wide southbound travel lanes from Lakes Boulevard to Springhill Farm Road.

Outside of the existing roadway shoulders, the existing roadway embankments are grassed or covered with heavy brush and trees, and generally appear to consist of slopes ranging from roughly 1H:1V to 6H:1V sloping up and down to the edge of right-of-way. Commercial and residential properties primarily border US 21.

2.1.2 SC 51

From the SC 51 and US 21 intersection eastward to the NC State Line, SC 51 roadway consists of one (1), roughly twelve (12) foot wide northbound/eastbound travel lane and one (1), roughly twelve (12) foot wide southbound/westbound travel lane.

Outside of the existing roadway shoulders, the existing roadway embankments are grassed or covered with heavy brush and trees, and generally appear to consist of slopes ranging from roughly 1.5:1V to 6H:1V sloping up and down to the edge of right-of-way. Commercial property primarily borders SC 51 for the area associated with this project.

2.2 Planned Development

This project is a Pennies for Progress project in York County, South Carolina that includes widening and realignment of approximately 2.9 miles of US 21 from SC Highway 460 (Springfield Parkway) to SC Highway 51 and SC Highway 51 from US 21 to the North Carolina and South Carolina border.

From our review of the plan, profile and cross section sheets contained in the *Proposed Plans for York County, US 21 from SC 460 (Springfield Pkwy) to 700 feet South of S-48 (Springhill Farm Road) and SC 51 from US 21 to the NC State Line*, prepared by STV, dated April 5, 2018 and design files dated March 8, 2021, the project includes adding a travel lane in each direction, adding a center turn lane, improvements to existing intersections and other impacted roadways, as well as the addition of sidewalks in each direction.

The roads and stations associated with the US 21 portion of the project are from Station 10+00 to Station 135+00. US 21 construction will require sliver fills, areas of minimal fills, and areas where up to 21 feet of new fill and up to 17 feet of cut in other areas to support the road widening. Proposed slopes along US 21 will be 2H:1V or flatter.

The stations associated with SC 51 for this project are from Station 295+62 to Station 340+00. SC 51 construction will require sliver fills, areas of minimal fills, and areas where up to 7 feet of new fill and up to 9 feet of cut in other areas to support the road widening. Proposed slopes along SC 51 will be 2H:1V or flatter.

Other roadways with intersection improvements included in this study are listed below:

- Springfield Parkway
- Mercantile Place
- Crescent Moon Drive
- Lakeview Road
- Amelia Drive
- Fern Forrest Court
- Lakeshore Drive
- Forrest Drive
- Embassy Drive
- Gold Hill Road
- Andrew L Tucker Road
- Old Nation Road
- Baxter Lane
- Garrison Farm Road
- Central Carolinas Parkway
- Regent Parkway
- Lakes Boulevard
- Flint Hill Road
- Retail Drive
- Terry's Road
- Springhill Farm Road

Other non-bridge structures will be created/modified to facilitate the additional lanes. The structures include 3 culvert extensions. The culvert improvements are planned at approximate stations US 21 33+80, US 21 41+06, and SC 51 316+23. Geotechnical recommendations for each culvert are included in Appendix VI of this report.

2.2.1 Realignments

This project involves several roadway realignments to improve intersections throughout the US 21 and SC 51 widening project. These areas are discussed in further detail below.

1. Gold Hill Road and Old Nation Road will be realigned to join US 21 as a Cross-Intersection at approximate Station 63+00 on the US 21 alignment. Gold Hill Road construction will require sliver fills, areas of minimal fills and areas where up to 28 feet of new fill and up to 13 feet of cut in other areas to support the realignment. Old Nation Road construction will require sliver fills, areas of minimal fills to support the realignment. The current intersection of Old Nation Road and US 21 will be configured to a cul-de-sac and rejoin the proposed Old Nation Road realignment as a T-Intersection.

2. The intersection of US 21 and SC Highway 51 will be configured to be a T-Intersection at approximate Station 129+00 on the US 21 alignment. The current intersection of SC 51 and US 21 will be configured to a cul-de-sac and rejoin the proposed SC 51 realignment as a T-Intersection at approximate Station 300+62.

3. Springhill Farm Road and Flint Hill Road will be realigned to join SC 51 as a Cross-Intersection at approximate Station 321+91 on the SC 51 alignment. Construction for these two realignments will require sliver fills and areas of minimal fills to support the realignment. The current intersection of Springhill Farm Road and SC 51 will be configured to a cul-de-sac. The current intersections of Springhill Farm Road and Flint Hill Road to SC 51 will be removed or abandoned.

3.0 Subsurface Exploration and Laboratory Testing

S&ME performed our subsurface explorations between May 18 and 22, 2015, July 25 through August 4, 2015, and December 15 through 21, 2015, conducting 81 standard penetration test (SPT) borings B-1 through B-11 (proposed roadways), C-1 through C-17 (existing intersecting roadways), R-1 through R-42 (existing alignment), and S-1 through S-11 (proposed structures). Hand augers with Dynamic Cone Penetrometer (DCP) testing were performed at six locations, HA-1 through HA-6, due to limited access. Rod soundings (RS-1 through RS-6) were also performed at the hand auger locations. Borings and testing were generally conducted at or near the proposed locations submitted to and approved by STV prior to the field exploration. Split-spoon, undisturbed and bulk samples were obtained, and laboratory testing was performed on selected samples.

In addition, asphalt cores were obtained at test locations C-1 through C-17, with Kessler Dynamic Cone Penetrometer (KDCP) testing of the base and subgrade. The pavement design recommendations were submitted under separate cover.

The approximate test locations are shown on the Test Location Plan (Sheets 1 through 13) in Appendix I. A summary table of the 87 test locations is included as Table 1 in Appendix IV and presents elevations, coordinates,

stationing, and offsets, which should be considered approximate. The elevations were interpolated from the topographic information provided by STV, the coordinates were measured in the field by an S&ME Staff Professional using a hand-held GPS unit, and the stations and offsets were determined based on plans provided by STV. Detailed graphical logs which describe the conditions and results at each test location are presented in Appendix IV.

SPT hammer energy measurements were previously performed with a Pile Driving Analyzer (PDA) on the drill rigs used to perform the borings on this project. The N-values indicated on the logs are field values and were not corrected for overburden stress, rod length, borehole diameter, or hammer efficiency. Hammer energy ratios are provided on the individual soil test boring records.

Following collection of the field-testing data, representative samples were returned to our laboratory for testing. The following table includes the quantity of testing relevant to the subject project:

Table 3-1: Laboratory Testing Quantity Table

Test Type	Quantity
Natural Moisture Content	91
Atterberg Limits	91
Full Sieve Analysis	6
Full Sieve Analysis w/Hydrometer	85
Standard Proctor	10
California Bearing Ratio	10
Consolidation	1
CU Triaxial	2
Organic Testing	3

Appendix IV presents a summary of the laboratory test results (Tables 2 through 5) and detailed results.

4.0 Subsurface Conditions

4.1 Area Geology

The project lies within the Piedmont Physiographic Province in York County, South Carolina. The Piedmont is bounded to the west by the mountains and east by the Coastal Plain physiographic provinces. The boundary separating the Piedmont and Coastal Plain is the fall line and the boundary separating the Blue Ridge Belt or more mountainous terrain is the Brevard Fault Zone. The Piedmont region was once a mountain range but through millions of years of erosion its terrain has been reduced to gently rolling hills and relatively flat areas. At the surface the Piedmont the soils are composed of residual soils. These are soils are derived from weathered in place crystalline rock. Through uplift and erosion these soils are continuously weathered and exposed at the surface. The residuum is typically finer grained and has a higher clay content near the surface because of advanced

weathering. Similarly, the soils typically become coarse grained with increasing depth because of decreased weathering. Piedmont residuum will often preserve the fabric (texture, appearance, foliations, etc.) of the parent crystalline rock that it is derived from and is called saprolite or described with the adjective, saprolitic. Beneath the residual soils lies a zone of partially weathered rock (PWR) that ranges in thickness from 1 to 15 feet. Underneath the PWR lies the parent bedrock or crystalline rock. The SPT test is used to determine where the zone of PWR begins and ends and where the crystalline rock (CR) boundary begins. The transition between hard/dense residual soils and PWR occurs at irregular depths due to variations in degree of weathering. Discontinuous lenses of PWR may be possible because of this and were observed in some locations along the project.

Geologically the project is located within the Charlotte Belt geologic province. The Charlotte Belt is mostly composed of plutonic bodies of rock with compositions ranging from granitic to gabbroic. These rocks were formed in the late Proterozoic to Cambrian periods during the Taconic orogeny when what is believed to be an exotic terrane in the form of a volcanic island arc was sutured to the North American craton. These rocks were later subjected to various degrees of metamorphism, folding and faulting during subsequent crustal reshaping and orogenic episodes. Rock types in this area are predominately composed of metavolcanics such as metagabbro and metadiorite and to a lesser extent biotite gneiss. The figure below shows a generalized geologic map of the Charlotte Belt in northeastern York County, SC and adjacent Mecklenburg County, NC from 'The Geology of the Carolinas' by Horton and Zullo (1991).

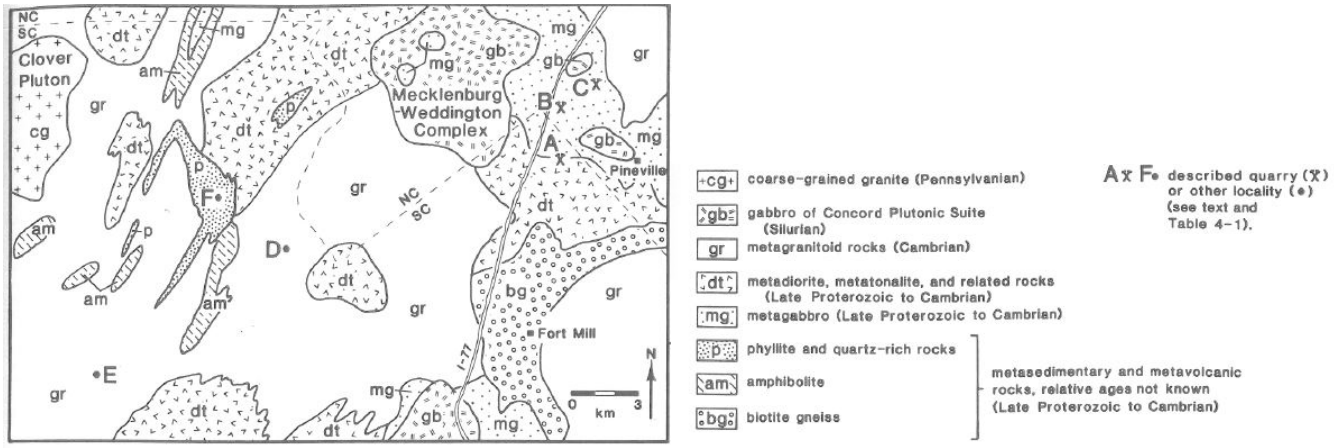

Fig. 4-3 from 'The Geology of the Carolinas' by Horton & Zullo (1991)

Water is typically present in the residual soils and within fractures in the PWR or underlying bedrock in the Piedmont. On upland ridges in the Piedmont, water may or may not be present in the residual soils above the PWR and bedrock. Alluvial soils, which have been transported and deposited by water, are typically found in floodplains and are generally saturated to within a few feet of the ground surface. Fluctuations in water levels are typical in residual soils and PWR in the Piedmont, depending on variations in precipitation, evaporation, and surface water runoff. Seasonal high-water levels are expected to occur during or just after the typically wetter months of the year (November through April).

4.2 Soil Properties

A summary of soil and rock strata encountered during the subsurface investigation for this project is shown in Table 4-1 and are further explained in the sections that follow.

Table 4-1: Summary of Soil and Rock Strata

Geotechnical Strata Designation	Depth Interval Range (feet)	USCS Soil Class or Rock Type	Range of Raw SPT N-values (bpf)	Soil and Rock Description
Existing Roadway Embankment Fill	0 to 30	SM, SC, ML, MH, CL, CH	3 to 27	Very loose to dense, moist to wet, fine to coarse sands, clayey sands and silty sands & soft to stiff, sandy silt, clayey silts, and clays.
Alluvium	4.5 to 19.5	SC, SM, CL	3 to 9	Very loose to dense, moist to wet, fine to coarse sands with trace to some non-plastic to medium plasticity fines, containing fine gravels and wood debris/organics. Contains some very soft, moist to wet, medium to high plasticity silts and clays with trace to some fine sands.
Piedmont Residuum	0 to 30	SM, SC, ML, MH, CL, CH	3 to 84	Medium dense to very dense, dry to wet, fine to coarse sands with little to some low to high plasticity fines. Contains some stiff to very hard, dry to moist, low to medium plasticity silts and clays with trace to some fine to medium sands. Some samples contain fine rock fragments and presented a relict rock structure.
Partially Weathered Rock (PWR)	4 to 37	SM, SC, ML	100+	Similar in consistency and appearance to overlying residuum but exhibited over 100 bpf

4.2.1 Surface Materials

Surface materials penetrated by the borings consisted of asphalt pavement where borings were performed within the existing roadway. Asphalt pavement thicknesses ranged from 2-12 inches, with base course materials approximately 3-8 inches. Also, concrete was beneath the asphalt in two borings (C-9 and C-17) measuring 7.5 and 9.5 inches thick.

4.2.2 *Roadway Embankment Fill*

The borings performed along or near the existing roadway encountered existing fill embankment materials beneath the pavement structure and roadway shoulders. Embankment fills extended to depths of 0 to 30 feet below the existing ground surface. The existing embankment fill materials generally consisted of fine to coarse sands with trace to some non-plastic to medium plasticity fines (SP, SP-SM, SM, SC, and SC-SM). Some of the sandy materials contained fine to coarse gravels.

Recovered samples of the existing embankment fill materials were brown, orange, and red in color and were generally moist to wet to the touch. Raw SPT N-values ranged from 3 to 27 blows per foot (bpf). Penetration resistances suggest very loose to medium dense relative densities in sandy soils.

Laboratory index testing was performed on selected samples from borings within the existing embankment fill. Moisture contents ranged from 2 to 39 percent. Soil specimens washed over a No. 200 sieve indicated 26 to 91 percent fines by weight. Atterberg limits testing resulted in liquid limits (LL) ranging from 22 to 83 and plasticity indexes (PI) ranging from 4 to 56.

One consolidated-undrained (CU) triaxial shear strength tests was performed on an undisturbed Shelby Tube sample in the embankment fill in boring number R-37. The triaxial shear strength test result is summarized in Table 4-2 and detailed results are presented in Appendix IV.

Table 4-2: Roadway Embankment Fill Triaxial Shear Strength Values

Boring No.	Sample No.	USCS Soil Type	Sample Depth (feet)	Total Strength Parameters		Effective Strength Parameters	
				c (psf)	ϕ (degrees)	c′ (psf)	ϕ’ (degrees)
R-37	UD-1	CL	13.5 – 15.5	0	15.6	0	37.7

4.2.3 *Alluvium*

Beneath the existing embankment fill materials, the borings along the alignment near existing streams and floodplains encountered alluvial deposits that extended to depths of 4 ½ to 19½ feet below the existing ground surface. Maximum penetrated thickness of alluvial soils in the borings was on the order of 10 feet. The alluvial deposits primarily consisted of fine to coarse sands with trace to some non-plastic to low plasticity fines (SP, SP-SM, SP-SC, SM, and SC) and some moderate to high plasticity clays and sandy clays (CL and CH). Recovered samples of the alluvial deposits were generally gray and brown in color and were moist to wet to the touch. Raw SPT N-values ranged from 3 to 9 bpf, indicating very loose to loose relative densities in the sandy deposits and soft to medium stiff consistencies in the clayey and silty deposits.

Laboratory index testing was performed on selected samples from borings within the alluvial deposits. Moisture contents ranged from 19 to 23 percent. Soil specimens washed over a No. 200 sieve indicated 44 to 72 percent fines by weight.

One consolidated-undrained (CU) triaxial shear strength tests was performed on an undisturbed Shelby Tube sample in the embankment fill in boring number R-41. The triaxial shear strength test result is summarized in Table 4-3 and detailed results are presented in Appendix IV.

Table 4-3: Alluvium Triaxial Shear Strength Values

Boring No.	Sample No.	USCS Soil Type	Sample Depth (feet)	Total Strength Parameters		Effective Strength Parameters	
				c (psf)	ϕ (degrees)	c′ (psf)	ϕ' (degrees)
R-41	UD-1	CH	13.5 – 15.5	530	11.5	40	37

One-dimensional consolidation (oedometer) test was conducted on an undisturbed sample of fine-grained soil recovered in Boring R-33 (23.5 to 25.8 feet), after the sample was trimmed and seated as described by ASTM D2435. The sample was loaded using the standard loading increment schedule per ASTM D2435. Consolidation of the sample under each increment/decrement of load was computed using the log-time method. A summary of the consolidation test result is presented in Table 4-4 and detailed results are presented in Appendix IV.

Table 4-4: Alluvium Consolidation Results

Boring No.	Sample No.	USCS Soil Type	Sample Depth (feet)	Moisture Content (%)	Percent Finer #200	Consolidation	
						P_c (ksf)	C_c
R-33	UD-1	SM	23.5-25.8	19.2	43.6	4.0	0.15

4.2.4 Piedmont Residuum/Partially Weathered Rock

Piedmont residual soils were encountered beneath the Alluvial and Embankment fill in the borings along the alignment. The residual Piedmont soils extend to depths of approximately 0 to 30 feet below the existing ground surface.

The residual Piedmont soils consisted of fine to coarse sands with little to some low to high plasticity fines (SM and SC) and low to medium plasticity silts and clays with trace to some fine to medium sands (ML). Some samples of the residuum contained fine rock fragments and presented a relict rock structure. Raw SPT N-values ranged from 3 to 84 bpf, indicating loose to very dense relative density in the sandy deposits and stiff to very hard in the silt deposits.

The term partially weathered rock (PWR) is applied to very dense or very hard Piedmont residuum that registers SPT N-values in excess of 100 blows per foot. Recovered samples of the PWR were generally similar in nature to the overlying Piedmont residuum. Layers of PWR were encountered within the residual strata in Borings S-6, C-4, R-6, R-9, and R-28 from depths of 17 to 27 feet. The PWR was underlain by medium dense to very dense Piedmont residual soils (N-values of 16 to 78 bpf) to the termination depths in borings R-6 and R-9.

Recovered samples of the Piedmont residuum and PWR were generally white, yellow, brown, and gray in color and were moist to wet to the touch. Raw SPT N-values ranged from 3 to 84 bpf, indicating very loose to very dense relative densities in the sandy soils and stiff to very hard consistencies in the silty soils.

Laboratory index testing was performed on selected samples from borings within the Piedmont residual soils. Moisture contents ranged from 17.9 to 29.3 percent. Soil specimens washed over a No. 200 sieve indicated 23.9 to 81.1 percent fines by weight. Atterberg limits testing resulted in LLs ranging from 34 to 59 and PIs ranging from 23 to 32.

4.2.5 Groundwater

Groundwater measurements were obtained at the time of and after approximately 24-hours in select borings. Due to the locations residing in an existing roadway, 24-hour ground water readings in some of the borings were not taken. Groundwater measurements were between 4± and 25± feet below ground surface. Groundwater levels are influenced by precipitation, long term climatic variations, and nearby construction. Measurements of ground water made at different times than our exploration may indicate ground-water levels substantially different than reported herein.

5.0 Seismic Considerations

As described in the GDM, evaluation of performance under the EEI or EEII limit states is not required for roadway embankments. In addition, there are no proposed bridges or earth retaining structures (ERS) within the project limits. Therefore, evaluation of performance under the EEI or EEII limit states is not required for this project.

6.0 Roadway Embankments

The following paragraphs include recommendations for site preparation, fill placement and compaction, and design and construction of embankments. If the construction scope is altered, the proposed embankment locations are changed, or if conditions are encountered during construction that differ from those encountered by the soil test borings, S&ME should be retained to review these recommendations based upon the new information and make any necessary changes.

6.1 Slope Stability Analyses

Based on Section 17.1 of the current GDM, embankments with heights of 10 feet or less and slopes 2H:1V or flatter do not require analysis. Slope stability analyses were performed using the computer program SLIDE Version 9 and Spencer circular and non-circular shear surfaces to find the critical shear surface and was performed in general accordance with Chapter 17 of the current GDM. Slope stability analysis outputs for the roadway embankments listed for the areas in Table 6-1 are included in Appendix II.

6.1.1 Fill Slopes

Soil test boring and laboratory testing results were incorporated into the soil parameters assumed for our Service Limit State analyses. Soil parameters assumed in global stability computations are included on the analysis

outputs in Appendix II. Our service limit state analyses considered the short-term (end-of-construction) condition as well as the long-term condition as defined in the GDM.

Soil parameters for the proposed embankment fill were conservatively estimated using the SCDOT *Borrow Materials Database Spreadsheet*, Version 2.0, dated December 6, 2018 for York County, assuming typical Upstate residual type soils and peak effective shear strengths. It was assumed that pore pressures induced by fill placement would have time to dissipate in the new fill soils. From our analyses, we provide the following results:

Table 6-1: Stability Analysis Summary

Alignment	Approximate Station	Slope (H:V)	Type	Approximate Height (feet)	Loading Condition	Resistance Factor	
						(computed)	(required)
US 21	23+50 LT	2:1	Fill Slope	19	Short-term	0.54	≤ 0.90
					Long-term	0.54	≤ 0.75
US 21	34+00 LT	2:1	Fill Slope	21	Short-term	0.60	≤ 0.90
					Long-term	0.61	≤ 0.75
US 21	34+00 RT	2:1	Fill Slope	19	Short-term	0.53	≤ 0.90
					Long-term	0.53	≤ 0.75
US 21	39+00 LT	2:1	Fill Slope	16	Short-term	0.55	≤ 0.90
					Long-term	0.60	≤ 0.75
US 21	41+50 LT	2:1	Fill Slope	13	Short-term	0.59	≤ 0.90
					Long-term	0.58	≤ 0.75
US 21	41+50 RT	2:1	Fill Slope	21	Short-term	0.59	≤ 0.90
					Long-term	0.61	≤ 0.75
US 21	43+50 RT	2:1	Fill Slope	16	Short-term	0.47	≤ 0.90
					Long-term	0.49	≤ 0.75
US 21	66+00 LT	2:1	Fill Slope	15	Short-term	0.43	≤ 0.90
					Long-term	0.45	≤ 0.75
US 21	67+00 LT	2:1	Fill Slope	19	Short-term	0.38	≤ 0.90
					Long-term	0.52	≤ 0.75
US 21	67+00 RT	2:1	Fill Slope	19	Short-term	0.38	≤ 0.90
					Long-term	0.36	≤ 0.75
US 21	68+00 LT	2:1	Fill Slope	11	Short-term	0.42	≤ 0.90
					Long-term	0.42	≤ 0.75
US 21	74+00 LT	2:1	Fill Slope	14	Short-term	0.28	≤ 0.90
					Long-term	0.40	≤ 0.75

From the above-summarized results, the computed resistance factors do not exceed the maximum resistance factor for roadway embankment in Table 9-5 of the GDM.

6.1.2 Cut Slopes

The following table identifies areas of cut slopes that are greater than 10 feet. Due to the existing heavily wooded and steeply sloped areas at the top of the cut slopes, drill rig access was restricted within the Right-of-Way, and the borings were not able to be performed for these areas during the exploration. However, no visible erosion or slope failure was present. The proposed cut slopes seem to be flatter than the existing slopes and S&ME believes the proposed slopes will meet the required resistance factors in Table 9-5 of the current GDM.

Table 6-2: Cut Slopes

Alignment	Approximate Begin Station	Approximate End Station	Slope (H:V)	Type
US 21	46+00 LT	52+00 LT	2:1	Cut Slope

6.2 Settlement Analysis

Fill placement of 10 feet or more is expected on some sections along US 21 to support the proposed roadway widening. In these areas, elastic compression and most consolidation settlements are expected to occur during embankment construction.

Settlement analysis for this project was performed for areas that were determined more susceptible to settlement based the amount of proposed fill and the underlying subsurface conditions. The areas were considered the critical sections for the project. Settlement analysis for this project was performed using the computer program Settle3 Version 5. Soil test boring and laboratory testing results were incorporated into the soil parameters for our analysis. The cohesive soil parameters and strength values used in the settlement analysis presented in Appendix III were estimated based on correlations from Chapter 7 of the GDM. The equations use to estimate the cohesive soil parameters and strength values are shown in Table 6-3 below. Settlement within the new fill under its own weight is estimated to be approximately 1 inch.

Table 6-3: Cohesive Soil Parameters for Settlement Analysis

Soil Parameter	Equation	Reference
Elastic Modulus (E_s)	56*($N^*_{1,60}$)	GDM Table 7-18
Compression Index (C_c)	0.014*(PI)	GDM Equation 7-89
Recompression Index (C_r)	0.1*C_c	GDM Section 7.13.2.2
Preconsolidation Stress (Pc)	$\frac{C}{(0.11 + 0.0037 * PI)}$	GDM Equation 7-93

Total settlement caused from the new fill was compared to performance limits provided in Tables 10-12 and 10-13 of the GDM. Settlement analyses are presented on the Settle3 output figures provided in Appendix III. From our analyses, we provide the following results:

Table 6-4: Settlement versus Performance Limits

Location of New Fill	EV-01A Settlement During Construction (inches)	EV-01B Total Post-Construction Settlement (inches)	EV-03 Longitudinal Differential Settlement (inches/50-ft)	EV-04 Transverse Differential Settlement (inches/5-ft)
US 21 Sta. 23+50 LT Slope	2.4	< 1	< 1	< 0.2
US 21 Sta. 34+00 LT Slope	1.4	< 1	< 1	< 0.2
US 21 Sta. 39+00 LT Slope	2.3	< 1	< 1	< 0.2
US 21 Sta. 67+00 LT Slope	2.0	< 1	< 1	< 0.2

From the above-summarized results, post-construction settlement of the embankments is anticipated to be minor and within GDM performance limits. As such, surcharging, wait periods, or the use of settlement plates following fill placement will not be needed to meet the objectives of the GDM. This assumes construction of the fill in accordance with SCDOT standard specifications for earthwork. Additional embankment fill due to long term settlement will not be required.

7.0 Earthwork Considerations

We assume the roadway subgrade, embankments, and cut slopes will be constructed in conformance with the SCDOT Standard Specifications for Highway Construction, 2007 edition, Division 200. Soils excavated during planned grading activities are Unclassified Excavation unless considered muck or rock excavation as described in Section 203.

7.1 Excavations

Based on the results of the soil test borings, we anticipate that the general excavation for this site will be in alluvial soils, fill and residual soils. Generally, these soils can be excavated using backhoes, trackhoes, front-end loaders, bull dozers and other types of typical earthmoving equipment. Partially weathered rock (PWR) was not encountered within anticipated excavation depths in any of the borings. However, the depth to, and thickness of, PWR, rock lenses or seams and bedrock, can vary dramatically in short distances and between boring locations; therefore, PWR, boulders or bedrock may be encountered during general excavation, excavation of footings and utilities at locations or depths between boring locations not encountered during this exploration.

All excavations should be sloped or shored in accordance with local, state, and federal regulations, including OSHA (29 CFR Part 1926) excavation trench safety standards. The contractor is solely responsible for site safety. This information is provided only as a service, and under no circumstances should S&ME be assumed to be responsible for construction site safety.

7.1.1 Muck Excavation

Based on the latest design files dated March 8, 2021 and provided by STV, some of the proposed roadway embankments will be constructed in or near isolated low-lying areas to support the planned roadway widening. The low-lying areas may consist of very loose to loose, wet alluvial soils, and standing water may be present at the existing ground surface and may require muck excavation. These soils may be unstable and may be difficult for conventional grading equipment to traverse without improvement. The contractor shall be prepared to provide equipment and perform temporary dewatering during construction. The areas where muck excavation may be required are identified in Table 7-1.

Table 7-1: Isolated Low-Lying Areas

Alignment	Begin Station	End Station	Direction	Begin Distance from Proposed Centerline (feet)	End Distance from Proposed Centerline (feet)	Estimated Depth Below Existing Ground Surface (feet)
US21*	33+00	34+50	Right	34	95	2
US21*	33+00	34+50	Left	53	100	2
US21*	40+50	43+50	Right	38	85	2
US21*	39+00	42+00	Left	39	82	2
US21	66+30	67+00	Right	36	71	2
US21	65+50	68+00	Left	52	103	2
SC51*	315+90	316+50	Left	24	63	2
SC51*	316+00	316+40	Right	24	66	2

*: Areas in the vicinity where proposed culverts extensions are planned.

As previously mentioned, there are three culvert extensions planned for the project. The table above summarizes the mucking required for the three culvert extensions; however, please refer to the Culvert Design Memos attached as appendices to this report, each dated August 5, 2021, for additional information.

Mucking and stabilization of these soils is required prior to placement of new embankment fill for the widened sections. The extent of undercutting or mucking will be dependent upon the prevailing weather conditions and the condition of the subgrade at the time of construction. Actual areas along the planned alignments requiring undercut or mucking are best determined in the field at the time of construction with joint consultation between the RCE and the Contractor.

7.2 Fill Soil Considerations

Borrow materials shall meet the requirements of subsection 203.2.1.8 of the Standard Specifications for York County.

The fill soil material properties used in slope stability analyses are provided in Table 7-2:

Table 7-2: Fill Material Properties Table

Soil Property	Value Used in Analysis
Effective Friction Angle, φ′	30°
Effective Cohesion, c′	300
Total Unit Weight, γ	120 pcf

All fill should be placed in uniform lifts of 8 inches or less (loose measure) and compacted to at least 95% of the standard Proctor maximum dry density. Existing slopes should be benched, and new fill should be "keyed" into the benched slope.

SCDOT specification 205.4.6 (Embankment Compaction) requires the Contractor to accomplish compaction by using suitable construction procedures while the material is at suitable moisture content. The contractor should implement procedures in the field to effectively control moisture content during placement. Permissible range of moisture content during placement will vary with soil classification, but silts or clays will need to be placed within -3 to +3 percent of the optimum moisture content.

7.3 Surface Preparation of Embankments

Embankments planned along existing embankment fills widened to accommodate the planned roadway alignment sections will require general preparation as described by the SCDOT standard specifications:

1. Clearing and Grubbing - Before starting embankment construction, clear and grub the embankment area according to Section 201 and install Drainage Structures according to the standard specifications.
2. Depressions and Undercut Areas - Fill depressions below the ground surface and undercut areas with suitable material. Remove unsuitable or unstable material and compact new fill according to Subsection 205.4.6 before beginning embankment construction.
3. Scarification and Other Preparation - Plow and scarify the entire area upon which the embankment is to be placed (except inundated areas) at least 6 inches deep.
4. Benching and Compaction of the Subgrade - Before placing the embankment, re-compact loosened soil to the approximate density of the underlying soil. Cut benches as specified in Subsection 205.4.4.
5. Compaction Under Shallow Fills - When the depth of fill and surfacing is 3 feet (1 m) or less, compact the original subgrade at least 1 foot deep to at least 95 percent of the maximum laboratory dry density as determined from representative samples of the compacted material. The in-place density of the compacted fill will be determined according to nuclear gage at random intervals.
6. Embankment Construction - Construct embankments in general accordance with specifications for materials, equipment, measurement, and payment provided in Section 205.

7.4 Shoulders and Slopes

Materials placed at the surface of shoulders and slopes may consist of materials removed from stockpiled soils stripped from within the right-of-way or from areas of roadway and drainage excavation. This may include friable materials capable of growing grass that resist erosion when compacted.

Due to the planned benching of the existing embankment slopes, existing subsurface utilities present along the existing alignment may be encountered. Existing utility lines located within right-of way and proposed excavation depths should be removed or plugged and relocated.

7.5 Removal / Undercut for Subgrade Stability

Based on the results of our laboratory testing and our visual classification, some of the soils encountered in the upper several feet in the borings were classified as A-7-5 and A-7-6 soils. The A-7-5 and A-7-6 soils are typically highly plastic and do not perform well as subgrade under pavement loadings. The areas that may require undercut are listed in Table 7-3 and Table 7-4. Undercut for subgrade stability is typically recommended to a depth of 1 to 3 feet below proposed subgrade elevations. Once areas are determined unsuitable and will require undercut, they should be replaced with acceptable fill. Actual undercutting, bridging, and/or geogrid quantities will be determined in the field at the time of construction by the RCE. Bridge lift materials should meet the latest *Bridge Lift Materials* Supplemental Specification, and geogrid should meet the latest *Geogrid Soil Reinforcement* Supplemental Specification. The stabilization methods used are best determined in the field at the time of construction.

US21 Bus.	16+87	B-4

7.6 Erosion

The slopes of the new embankments and cut locations will be susceptible to erosion during rainfall events. Construction operations should be performed in a manner consistent with good erosion control practices that minimize soil erosion as described in Subsections 205.4.1, 205.4.1.2, and 205.4.7 of SCDOT Standard Specifications for Highway Construction, 2007 edition. We recommend diverting surface water runoff of slopes by use of berms along the crest and temporary drainage piping. We recommend the slopes be seeded and grassed as soon as practical to minimize the effects of erosion.

7.7 Cross-Line Pipes

Based off the provided plans dated April 5, 2018, provided by STV, Table 7-4 provides a summary of planned crossline pipes and provides details of pipe location, size, and length as indicated by the cross sections. Table 7-4 also list bearing soil type and SPT N-Values near the pipe invert elevations. Special excavation may be required to install some of these pipes where very dense soils or subsurface water is present. Table 7-4 does not list proposed culverts or the cross-line pipes on the proposed Gold Hill Road realignment.

Table 7-4: Summary of Crossline Pipes

Pipe Details	Approx. Station	Approx. Length (feet)	Invert Elev. at CL (feet)	Boring, Soil Description at Invert Elevation, and Estimate N-Value

Roadway widening of areas at the location of cross-line pipes NP-518 and NP-519 will require new embankment fill heights greater than 10 feet. Most of the settlement of the new fill and existing subsurface soils are expected to occur during construction of the new embankment with less than one inch of settlement to occur post-construction. The contractor shall consider an appropriate construction sequence for the installation of cross-lined pipes NP-518 and NP-519 to minimize the impact of settlement of the new pipes.

Other proposed crossline pipes will be installed in areas of the roadway embankment that require little to no fill to reach planned grade. Therefore, settlement is not considered an issue at these locations.

As mentioned in above sections, there are three culvert improvements planned at approximate stations US 21 33+80, US 21 41+06, and SC 51 316+23. Geotechnical recommendations for each culvert are included in Appendix VI of this report.

8.0 Recommended Plan Notes

Place the following notes on the Roadway Plans.

8.1 Embankments

Cut benches as specified in Subsection 205.4.4.

8.2 Borrow Materials

Borrow materials shall meet the requirements of subsection 203.2.1.8 of the Standard Specifications for York County.

8.3 Muck Excavation

The areas listed in the above Table 7-1 (Isolated Low-Lying Areas), have been identified as areas where muck excavation may be required. Areas along the planned alignments requiring undercut or mucking are to be determined in the field at the time of construction with joint consultation between the RCE, GEOR, and the Contractor.

Any additional areas that are discovered to deflect or settle may require muck excavation as directed by the RCE. The RCE will determine the lateral extent of the undercutting. The undercutting should not extend beyond the toe of slope. The final depth of muck excavation shall not exceed 5 feet, unless otherwise specified in the plans and/or Specifications. Contact the Geotechnical Engineer-of-Record (GEOR) if muck excavation needs to exceed 5 feet and it has not been previously specified in the plans or Specifications.

If the undercutting completely removes the materials identified as muck, then bridge lift materials may be placed directly on the firm materials.

If because of the depth of muck, muck materials must be left in place, place a stabilization geosynthetic meeting the requirements of SC-M-203-6, Geosynthetic Materials for Separation and Stabilization. After the placement of the initial bridge lift material, expose approximately 1 square foot of the geosynthetic for visual observation to

identify any damage caused by the placement of the bridge lift material. After ascertaining that the geosynthetic has not been damaged, replace the bridge lift material excavated to allow observation of the geosynthetic. If the geosynthetic appears to be damaged, expose a larger area and contact the GEOR for instructions. Any damaged areas shall be repaired by the Contractor at no expense to the Department.

Any ruts that develop in bridge lift materials shall be filled in with similar bridge lift materials. Do not blade down the ruts since this will decrease the thickness of the bridge lift.

In areas that require mucking or undercutting, borrow material soil may be placed as a bridge lift as long as the grade on which the material is being placed is at least 2 feet above the groundwater or surface water level. Place borrow material bridge lifts in single lift thicknesses no greater than 2 feet. Do not place a bridge lift consisting of borrow material within 3 feet of the base of the pavement section. Place only compacted borrow material soil or stone bridge lift within this zone.

In the event that groundwater/surface water does not allow backfilling with borrow material soil, use either No. 57 stone or granular bridge lift materials meeting the requirements of Bridge Lift Materials Supplement Specification. Place the bridge lift materials in single lifts not exceeding a 2-foot thickness. If additional compacted borrow material soil is needed to reach grade, place a geotextile for separation meeting the requirements of SC-M-203-6, Geosynthetic Materials for Separation and Stabilization between the stone bridge lift and the overlying compacted soil. After the placement of the initial lift of compacted material, expose approximately 1 square foot of the geosynthetic for visual observation to identify any damage caused by the placement of the compacted material. After ascertaining that the geosynthetic has not been damaged, replace and compact the material excavated to allow observation of the geosynthetic. If the geosynthetic appears to be damaged, expose a larger area and contact the GEOR for instructions. Any damaged areas shall be repaired by the Contractor at no expense to the Department.

The expected bid items associated with mucking and undercutting (i.e., mucking, bridge lift material, geogrid, and geotextile for separation of sub-grade and sub-base) are listed in Table 8-1. Do not purchase or stockpile these bid items on site without prior written approval from the RCE unless specific areas and details are defined in the plans.

Table 8-1: Expected Bid Items

Item No.	Pay Item	Inclusion Quantity
2034000	Muck Excavation	4650 CY
2036020	Geotextile, Separation	7000 SY
2037030	Geogrid, Stabilization	200 SY
2052010	Stone Bridge Lift Material	6500 tons

8.4 Earthborne Vibration Monitoring

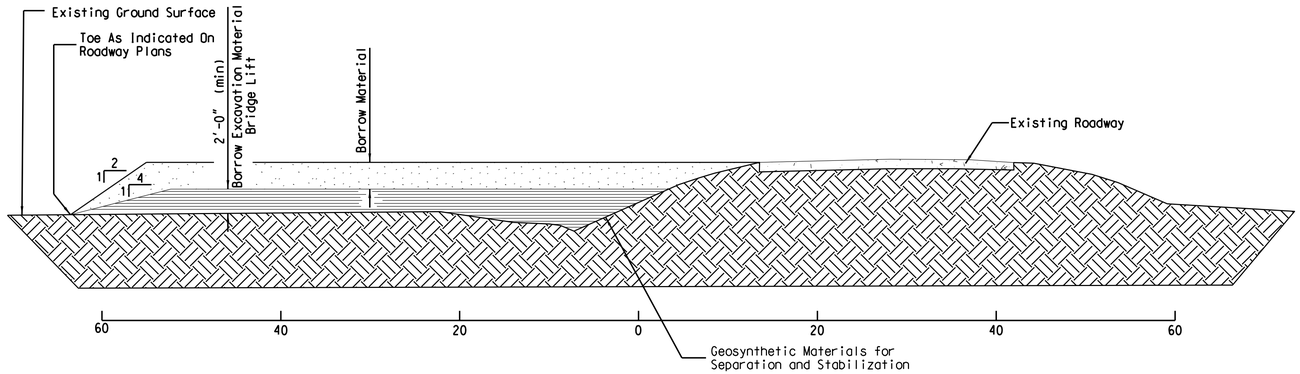
Level 1 – York County has elected to not monitor the site; therefore, no Earth-borne Vibration Monitoring is required.

9.0 Closing

This report has been prepared in accordance with generally accepted geotechnical engineering practice for specific application to this project. The conclusions and recommendations contained in this report are based upon applicable standards of our practice in this geographic area at the time this report was prepared. No other warranty, express or implied, is made.

We relied on project information given to us to develop our conclusions and recommendations. If project information described in this report is not accurate, or if it changes during project development, we should be notified of the changes so that we can modify our recommendations based on this additional information if necessary.

Our conclusions and recommendations are based on limited data from a field exploration program. Subsurface conditions can vary widely between explored areas. Some variations may not become evident until construction. If conditions are encountered which appear different than those described in our report, we should be notified. This report should not be construed to represent subsurface conditions for the entire site.



Unless specifically noted otherwise, our field exploration program did not include an assessment of regulatory compliance, environmental conditions or pollutants or presence of any biological materials (mold, fungi, bacteria). If there is a concern about these items, other studies should be performed. S&ME can provide a proposal and perform these services if requested.

S&ME should be retained to review the final plans and specifications to confirm that earthwork, foundation, and other recommendations are properly interpreted and implemented. The recommendations in this report are contingent on S&ME's review of final plans and specifications followed by our observation and monitoring of earthwork and foundation construction activities.

Borrow Materials

Borrow materials shall meet the requirements of subsection 203.2.1.8 of the Standard Specifications for York County.

Earthborne Vibration Monitoring

Level 1 York County has elected to not monitor the site; therefore, no Earth-borne Vibration Monitoring is required. York County assumes all risk for any potential damage.

Muck Excavation

The following approximate areas have been identified as requiring muck excavation in accordance with Pay Item 2034000. Areas along the planned alignments requiring undercut or mucking are to be determined in the field at the time of construction with joint consultation between the RCE, GEOR, and the Contractor:

ALIGNMENT	Begin Station	End Station	Direction	Begin Distance from Proposed Centerline, ft.	End Distance from Proposed Centerline, ft.	Estimated Depth Below Existing Ground Surface, ft.
US 21	33+00	34+50	RIGHT	34	95	2
US 21	33+00	34+50	LEFT	53	100	2
US 21	40+50	43+50	RIGHT	38	85	2
US 21	39+00	42+00	LEFT	39	82	2
US 21	66+30	67+00	RIGHT	36	71	2
US 21	65+50	68+00	LEFT	52	103	2
SC 51	315+90	316+50	LEFT	24	63	2
SC 51	316+00	316+50	LEFT	24	66	2

Additional areas discovered to deflect or settle may require muck excavation or undercutting as directed by the RCE. Lateral extent of undercutting to be defined by the staked toe line of the slope. The depth of undercutting or muck excavation to be determined by the RCE with consultation with the GEOR.

If the undercutting completely removes the materials identified as muck, then bridge lift materials may be placed directly on the firm materials.

Areas that cannot be stabilized by proof-rolling may optionally be stabilized by construction of a bridge lift. The bridge lift if performed must include a stabilization geosynthetic meeting the requirements of SC-M-203-1, Geosynthetic Materials for Separation and Stabilization at the base of the lift. After the placement of the initial bridge lift material, expose approximately 1 square foot of the geosynthetic for visual observation to identify any damage caused by the placement of the bridge lift material. After ascertaining that the geosynthetic has not been damaged, replace the bridge lift material excavated to allow observation of the geosynthetic. If the geosynthetic appears to be damaged, expose a larger area and contact the GEOR for instructions. Damaged areas shall be repaired by the Contractor at no expense to the Department.

Any ruts that develop in bridge lift materials shall be filled in with similar bridge lift materials. Do not blade down the ruts, since this will decrease the thickness of the bridge lift.

In areas that require mucking or undercutting, approved borrow material may be placed as a bridge lift as long as the grade on which the material is being placed is at least 2 feet above the groundwater or surface water level at the time of construction. Place borrow material bridge lifts in single lift thicknesses no greater than 2 feet. Do not place a bridge lift consisting of borrow material within 3 feet of the base of the pavement section. Place only compacted borrow material soil or stone bridge lift within this zone.

Contractor shall use either stone or granular bridge lift materials meeting the requirements of Bridge Lift Materials Supplement Specification. Place the bridge lift materials in single lifts not exceeding a 2-foot thickness. If additional compacted borrow material soil is needed to reach grade, place a geotextile for separation meeting the requirements of SC-M-203-1, Geosynthetic Materials for Separation and Stabilization between the stone bridge lift and the overlying compacted soil. After the placement of the initial lift of compacted material, expose approximately 1 square foot of the geosynthetic for visual observation to identify any damage caused by the placement of the compacted material. After ascertaining that the geosynthetic has not been damaged, replace and compact the material excavated to allow observation of the geosynthetic. If the geosynthetic appears to be damaged, expose a larger area and contact the GEOR for instructions. Any damaged areas shall be repaired by the Contractor at no expense to the Department.

The following quantities associated with mucking and undercutting, i.e. mucking, bridge lift material, geogrid, and geotextile for separation of sub-grade and sub-base, are for bid estimation purposes only. The Estimated Quantity is the total quantity estimated for a specific item to be used on the project, while the Inclusion Quantity is the additional quantity that may be required in areas not previously identified on the plans as needing the item. Do not purchase or stockpile these bid items on site without prior written approval from the RCE unless specific areas and details are defined in the plans.

Item No.	Pay Item	Quantity
2034000	Muck Excavation	4650 CY
2052010	Stone Bridge Lift Material	6500 TONS
2036020	Geotextile Separation	7000 SY
2037030	Geogrid, Stabilization	200 SY

Dewatering, if required, is incidental to muck excavation and shall not have a separate pay item.

Embankments

Transverse differential settlement should be anticipated between a widened portion of the embankment and the existing embankment. The widened embankment will induce loading on the existing embankment that will in turn cause settlement of the existing embankment. This settlement may potentially cause damage to the existing embankment. Damage is anticipated and the Contractor is responsible for maintaining the existing travel way. The GEOR will coordinate with Construction to determine the quantities required to maintain the existing travel way.

Cut benches as specified in Subsection 205.4.4.

	SC	YORK	0042332	US21 & SC 51	G2

US21 CULVERTS AT STA. 33+80 & 41+06

A minimum of 18 inches of #57 Stone for bedding shall be placed under the culvert extensions, and a non-woven geotextile shall be placed so that the 57 Stone is separated on all sides from the surrounding and underlying soils.

If conditions are encountered that require mucking or undercutting use No. 57 stone as borrow material. The depth to which mucking or undercutting is required is dependent upon encountering a suitable bearing material within the excavation as determined by the Geotechnical Engineer of Record. When using No. 57 Stone to backfill undercut areas, use a non-woven geotextile to separate the No. 57 Stone from the surrounding soils. If muck excavation is required, refer to the Supplemental Specification for Muck Excavation.

Based on the borings and the culvert extension invert elevations, excavation into PWR and/or rock may be required during construction of the culvert extensions. Excavation into PWR and/or rock should be anticipated for the Station 33+80 culvert upstream and downstream extensions. Excavation into PWR and/or rock should be anticipated for the Station 41+06 culvert upstream extension.

Where PWR and Rock are encountered, excavation of these materials shall be paid as structure excavation.

SC51 CULVERT AT STA. 316+23

A minimum of 18 inches of #57 Stone for bedding shall be placed under the culvert extension, and a non-woven geotextile shall be placed so that the 57 Stone is separated on all sides from the surrounding and underlying soils.

If conditions are encountered that require mucking or undercutting use No. 57 stone as borrow material. The depth to which mucking or undercutting is required is dependent upon encountering a suitable bearing material within the excavation as determined by the Geotechnical Engineer of Record. When using No. 57 Stone to backfill undercut areas, use a non-woven geotextile to separate the No. 57 Stone from the surrounding soils. If muck excavation is required, refer to the Supplemental Specification for Muck Excavation.

Based on the borings and the culvert extension invert elevations, excavation into PWR and/or rock may be required during construction of the culvert extensions.

Where PWR and Rock are encountered, excavation of these materials shall be paid as structure excavation.

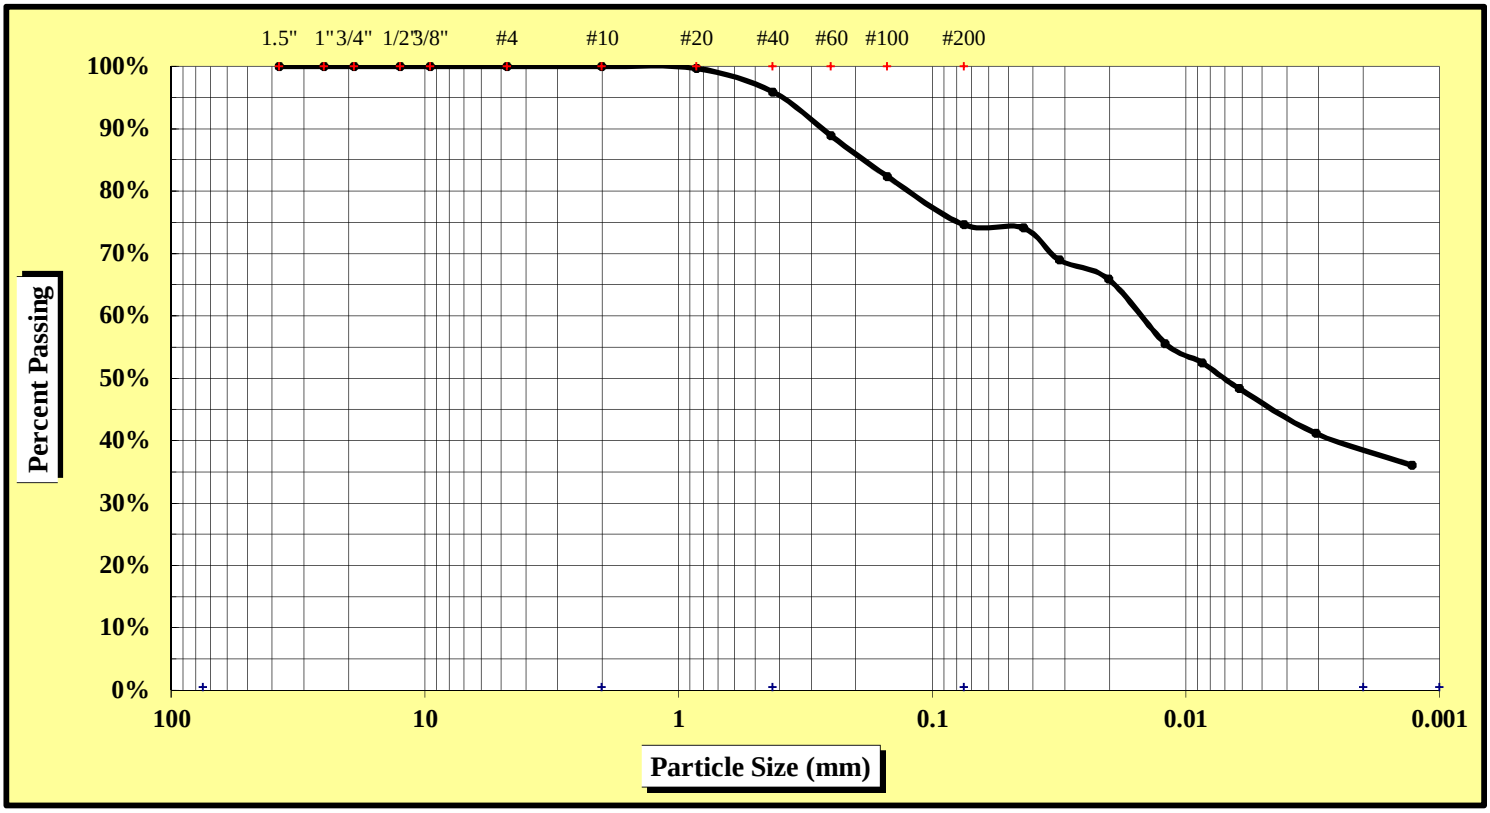
Particle Size Analysis of Soils

AASHTO T 88



S&ME Project #: **1351-12-037 (01)** Report Date: 7/16/15

Project Name: **SCDOT US 21 to SC 51**

Client Name: STV

Client Address: NA

Boring #:	B-1	Sample #: SS-2	Sample Date: 2014/2015
Route-Station:	Forest Dr. 10+73	Offset: 6' LT	Depth: 2.4-4.0'
Sample Description:	Orange Brown Clay w/Coarse to Fine Sand (CH)		A-7-5

As Defined by AASHTO		Fine Sand	< 0.425 mm and > 0.075 mm
Gravel	< 75 mm and > 2.00 mm	Silt	< 0.075 and > 0.002 mm
Coarse Sand	< 2.00 mm and > 0.425 mm	Clay	< 0.002 mm

Gravel	0.0%	Coarse Sand	4.1%	Silt	36%
Maximum Particle Size	#20	Fine Sand	21.3%	Clay	39%
Apparent Relative Density(Assumed)	2.650	Moisture Content	28.0%	Silt & Clay (% Passing #200)	74.6%
Liquid Limit	60	Plastic Limit	30	Plastic Index	30

Description of Sand & Gravel Particles: Rounded ☐ Angular ☒ Hard & Durable ☒ Soft ☐ Weathered & Friable ☐

Mechanical Stirring Apparatus (A) Length of Dispersion Period: 1 min. Dispersing Agent: Sodium Hexametaphosphate: 40 g./ Liter

References: AASHTO T88: Particle Size Analysis of Soils AASHTO T87: Dry Preparation of Disturbed Soil and Soil Aggregate Samples for Test

Project Name: **SCDOT US 21 to SC 51**

Client Name: STV

Client Address: NA

Boring #:	C-7	Sample #: SS-1	Sample Date: 2014/2015
Route-Station:	Lakeshore Dr. 12+54	Offset: 5' RT	Depth: 1-2.5'
Sample Description:	Reddish Orange Brown Coarse to Fine Sandy Silty Clay (CL)		A-6

As Defined by AASHTO		Fine Sand	< 0.425 mm and > 0.075 mm
Gravel	< 75 mm and > 2.00 mm	Silt	< 0.075 and > 0.002 mm
Coarse Sand	< 2.00 mm and > 0.425 mm	Clay	< 0.002 mm

Gravel	0.9%	Coarse Sand	7.6%	Silt	30%
Maximum Particle Size	#4	Fine Sand	28.1%	Clay	34%
Apparent Relative Density(Assumed)	2.650	Moisture Content	5.7%	Silt & Clay (% Passing #200)	63.4%
Liquid Limit	36	Plastic Limit	17	Plastic Index	19

Description of Sand & Gravel Particles: Rounded ☐ Angular ☒ Hard & Durable ☒ Soft ☐ Weathered & Friable ☐

Mechanical Stirring Apparatus (A) Length of Dispersion Period: 1 min. Dispersing Agent: Sodium Hexametaphosphate: 40 g./ Liter

Client Name:	STV		
Client Address:	NA		

Boring #:	R-3	Sample #:	SS-5	Sample Date:	2014/2015
Station-Route	US 21 28+68	Offset:	29' RT	Depth:	8.5 - 10.0 ft
Sample Description:	Tan White Black Clayey Coarse to Fine Sand (SC)				A-6

As Defined by AASHTO		Fine Sand	< 0.425 mm and > 0.075 mm
Gravel	< 75 mm and > 2.00 mm	Silt	< 0.075 and > 0.002 mm
Coarse Sand	< 2.00 mm and > 0.425 mm	Clay	< 0.002 mm

Gravel	4.6%	Coarse Sand	24.0%	Silt	37%
Maximum Particle Size	No. 4	Fine Sand	28.6%	Clay	6%
Specific Gravity (Assumed)	2.680	Moisture Content	19.2%	Silt & Clay (% Passing #200)	42.8%
Liquid Limit	39	Plastic Limit	24	Plastic Index	15

Description of Sand & Gravel Particles: Rounded ☒ Angular ☒ Hard & Durable ☒ Soft ☐ Weathered & Friable ☐

Mechanical Stirring Apparatus (A) Length of Dispersion Period: 1 min. Dispersing Agent: Sodium Hexametaphosphate: 40 g./ Liter

Location:	NA	Sample: SS-6	Elevation: 13.5-15'

Sample Description: Reddish Brown Clayey Silt w/Medium to Fine Sand (MH) **A-7-5**

Cobbles	< 300 mm (12") and > 75 mm (3")	Fine Sand	< 0.425 mm and > 0.075 mm (#200)
Gravel	< 75 mm and > 4.75 mm (#4)	Silt	< 0.075 and > 0.005 mm
Coarse Sand	< 4.75 mm and >2.00 mm (#10)	Clay	< 0.005 mm
Medium Sand	< 2.00 mm and > 0.425 mm (#40)	Colloids	< 0.001 mm

Maximum Particle Size	#10	Coarse Sand	0.4%	Fine Sand	14.3%
Gravel	0.0%	Medium Sand	3.2%	Silt & Clay	82.0%
Liquid Limit	70	Plastic Limit	36	Plastic Index	34
Specific Gravity	ND			Moisture Content	39.4%
Coarse Sand	0.4%	Medium Sand	3.2%	Fine Sand	14.3%

Description of Sand & Gravel Particles: Rounded ☐ Angular ☒
Hard & Durable ☒ Soft ☐ Weathered & Friable ☐

Particle Size Analysis of Soils

AASHTO T 88

S&ME Project #:	**1351-12-037 (010)**	Report Date:	8/4/15
Project Name:	**SCDOT US 21 to SC 51**	Test Date(s):	6/8-7/25/15
Client Name:	STV		
Client Address:	NA		

Boring #:	HA-3	Sample #:	SS-2	Sample Date:	2014/2015
Route-Station	NA	Offset:	NA	Depth:	6'
Sample Description:	Gray Coarse to Fine Sandy Silty Clay (CL)				A-6

As Defined by AASHTO		Fine Sand	< 0.425 mm and > 0.075 mm
Gravel	< 75 mm and > 2.00 mm	Silt	< 0.075 and > 0.002 mm
Coarse Sand	< 2.00 mm and > 0.425 mm	Clay	< 0.002 mm

Gravel	1.5%	Coarse Sand	10.7%	Silt	36%
Maximum Particle Size	#4	Fine Sand	35.8%	Clay	17%
Specific Gravity (Assumed)	2.650	Moisture Content	30.6%	Silt & Clay (% Passing #200)	52.0%
Liquid Limit	29	Plastic Limit	18	Plastic Index	11

Description of Sand & Gravel Particles: Rounded ☒ Angular ☒ Hard & Durable ☒ Soft ☐ Weathered & Friable ☐

Mechanical Stirring Apparatus (A) Length of Dispersion Period: 1 min. Dispersing Agent: Sodium Hexametaphosphate: 40 g./ Liter

References: AASHTO T88: Particle Size Analysis of Soils AASHTO T87: Dry Preparation of Disturbed Soil and Soil Aggregate Samples for Test

Moisture, Ash, and Organic Matter

ASTM D-2974

Quality Assurance

S&ME, Inc. Raleigh, 3201 Spring Forest Raod, Raleigh, North Carolina 27616

Project #:	3405-15-022	Report Date:	6/15/15
Project Name:	SCDOT US 21/51	Test Date(s):	6/12 - 6/15/15
Client Name:	SCDOT US		
Client Address:			

Boring #:	R-18	Sample #:	SS-1	Sample Date:	Unknown
Location:	Site-Borehole	Offset:	N/A	Depth (ft):	0.5 - 2.0 ft.

Sample Description: Brown Sandy CLAY with Organics

Equipment: *Balance: 0.01 g.Readability, 500g. Minimum Capaccity*

Balance: *S&ME ID #:* ***1024*** *Cal. Date:* ***11/4/14*** *Due:* ***11/4/15***

Method A: Moisture Content Determination

Required Oven Temperature:105 ± 5 °C

	Oven Temperature: **105 °C**	*Tare #*	116
t	Tare Weight *(Dish plus Aluminum Foil Cover)*	*grams*	117.87
a	Mass of ***As-Received*** Specimen + Tare Wt.	*grams*	254.20
b	Mass of Oven Dry Specimen + Tare Wt.	*grams*	234.63
w	Water Weight	*(a-b)*	19.57
A	Mass of As-Received Specimen	*(a-t)*	136.33
B	Mass of Oven Dry Specimen	*(b-t)*	116.76
	% Moisture Content as a % of As Received or Total Mass	*(w/A)*100*	**14.4%**
	% Moisture Content as a % of Oven-dried Mass	*(w/B)*100*	**16.8%**

Oven *S&ME ID #:* ***1454*** *Cal. Date:* ***10/1/14*** *Due:* ***10/1/15***

Method C (440 °C) or D (750 °C): Ash Content and Organic Matter Determination

	Muffle Furnace: **440 °C**	*Tare #*	6
t	Tare Weight *(Dish plus Aluminum Foil Cover)*	*grams*	21.04
b	Mass of Oven Dry Specimen + Tare Wt.	*grams*	102.73
c	Ash Weight + Tare Wt.	*grams*	100.83
C	Ash Weight	*c-t*	79.79
B	Mass of Oven Dry Specimen	*(b-t)*	81.69
D	***% Ash Content***	*(C/B)*100*	**97.7%**
	% Organic Matter	*100-D*	**2.3%**

Muffle Furnace: *S&ME ID #:* ***00261***

CBR (California Bearing Ratio) of Laboratory Compacted Soil

AASHTO T 193

Quality Assurance

S&ME, Inc. ~ 9751 Southern Pine Boulevard ~ Charlotte, NC 28273

Project #:	**1351-12-037 (01)**	Report Date:	8/5/15
Project Name:	SCDOT US 21 to SC 51	Test Date(s)	6/15-23/15
Client Name:	STV		
Client Address:	NI		

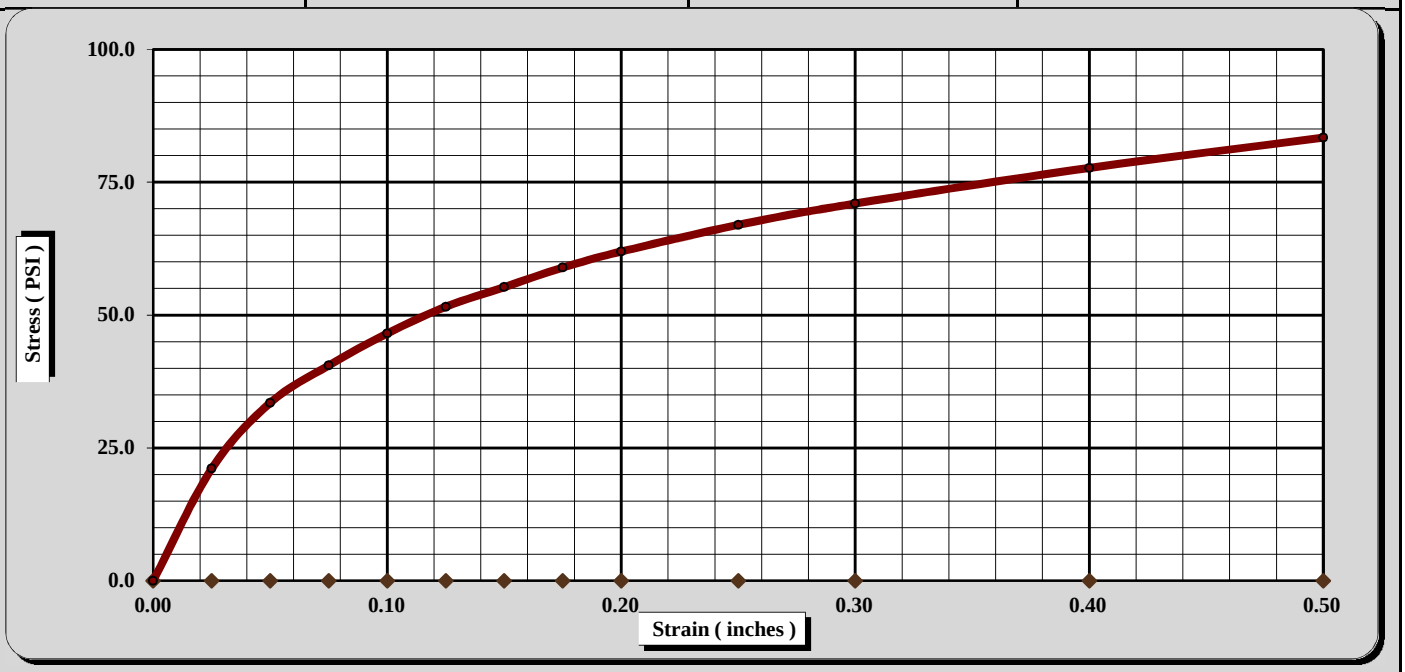
Boring #: R-28 Sample #: Bulk Sample Date: 2014/2015



Route-Station: SC 51 318+60 Offset: 26' LT Elevation: 1-10'

Sample Description: Gray Clayey Coarse to Fine Sand (SC) w/Gravel A-6

AASHTO T99 *Method A* Maximum Dry Density: **115.7** **PCF** Optimum Moisture Content: **14.1%**

Compaction Test performed on the Fine Fraction only % Retained on the 3/4" sieve: **0.0%**

Uncorrected CBR Values		Corrected CBR Values	
CBR at 0.1 in. 4.7	**CBR at 0.2 in. 4.1**	**CBR at 0.1 in. 0.0**	**CBR at 0.2 in. 0.0**

CBR Sample Preparation: *Performed on the fine fraction*

The replacement method was used and compacted in a 6" CBR mold in accordance with AASHTO T 193, Section 5.1.1

Before Soaking		*After Soaking*	
Compactive Effort (Blows per Layer)	22	Final Dry Density (PCF)	105.5
Initial Dry Density (PCF)	109.1	Average Final Moisture Content	17.3%
Moisture Content of the Compacted Specimen	14.1%	Moisture Content (top 1" after soaking)	17.3%
Percent Compaction	94.3%	Percent Swell	0.5%

Soak Time: 96 Hours Surcharge Weight 30.5 Surcharge Wt. per sq. Ft. 155.0

Liquid Limit 37 Plastic Index 18 Apparent Relative Density ND

Notes/Deviations/References: NI = No information provided. ND = Not determined.

Parameters for Specimen No. 2

Specimen Parameter	Initial	Saturated	Consolidated	Final
Moisture content: Moist soil+tare, gms.	243.180			653.910
Moisture content: Dry soil+tare, gms.	223.140			519.640
Moisture content: Tare, gms.	112.380			74.530
Moisture, %	18.1	22.4	18.3	30.2
Moist specimen weight, gms.	1237.51			
Diameter, in.	2.868	2.858	2.792	
Area, in.²	6.460	6.417	6.123	
Height, in.	6.011	5.991	5.854	
Net decrease in height, in.		0.020	0.137	
Wet density, pcf	121.4	127.1	131.8	
Dry density, pcf	102.8	103.8	111.4	
Void ratio	0.6092	0.5932	0.4853	
Saturation, %	78.7	100.0	100.0	

Test Readings for Specimen No. 2

Consolidation cell pressure = 91.00 psi (13.10 ksf)
Consolidation back pressure = 70.00 psi (10.08 ksf)
Consolidation effective confining stress = 3.02 ksf
Strain rate, in./min. = 0.004
Fail. Stress = 3.33 ksf **at reading no.** 38
Ult. Stress = 4.56 ksf **at reading no.** 107

Parameters for Specimen No. 3

Specimen Parameter	Initial	Saturated	Consolidated	Final
Moisture content: Moist soil+tare, gms.	243.380			926.830
Moisture content: Dry soil+tare, gms.	223.140			738.030
Moisture content: Tare, gms.	112.380			74.360
Moisture, %	18.3	24.7	20.9	28.4
Moist specimen weight, gms.	1140.68			
Diameter, in.	2.862	2.852	2.793	
Area, in.²	6.433	6.389	6.126	
Height, in.	5.770	5.750	5.632	
Net decrease in height, in.		0.020	0.118	
Wet density, pcf	117.1	124.7	128.7	
Dry density, pcf	99.0	100.0	106.5	
Void ratio	0.6714	0.6540	0.5534	
Saturation, %	72.1	100.0	100.0	

Test Readings for Specimen No. 3

Consolidation cell pressure = 105.00 psi (15.12 ksf)
Consolidation back pressure = 70.00 psi (10.08 ksf)
Consolidation effective confining stress = 5.04 ksf
Strain rate, in./min. = 0.004
Fail. Stress = 2.71 ksf **at reading no.** 44
Ult. Stress = 3.33 ksf **at reading no.** 104

Type of Test:
CU with Pore Pressures

Sample Type: Undisturbed

Description: Red Brown Clay w/Medium to Fine Sand (CH) A-7-6

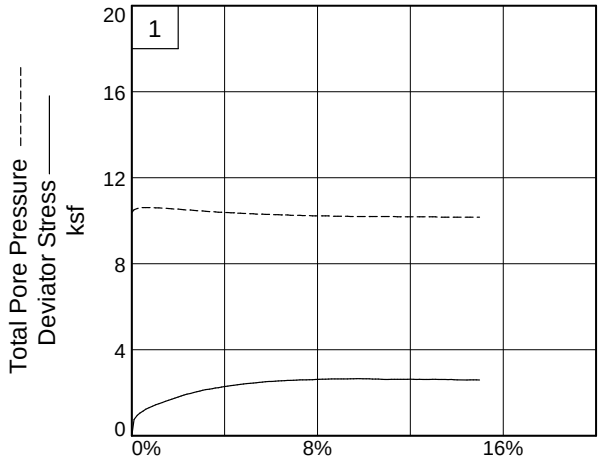
LL= 67 **PL=** 25 **PI=** 42

Assumed Specific Gravity= 2.65

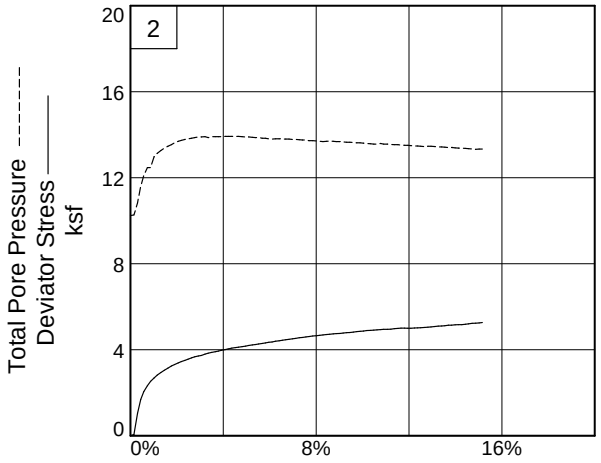
Remarks: The specimens failed in bulging. Only 2 specimens could be obtained from tube. ASTM D4767

Figure R-41 UD-1

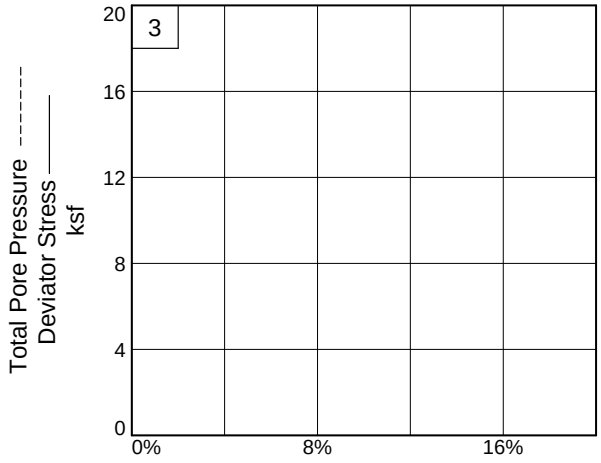
Client: STV



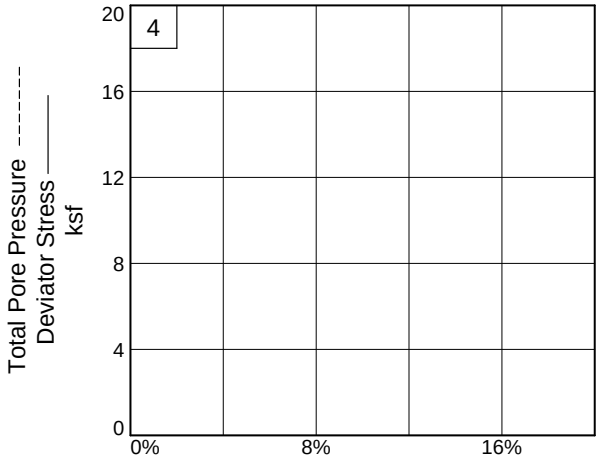
Project: SCDOT US 21 to SC 51



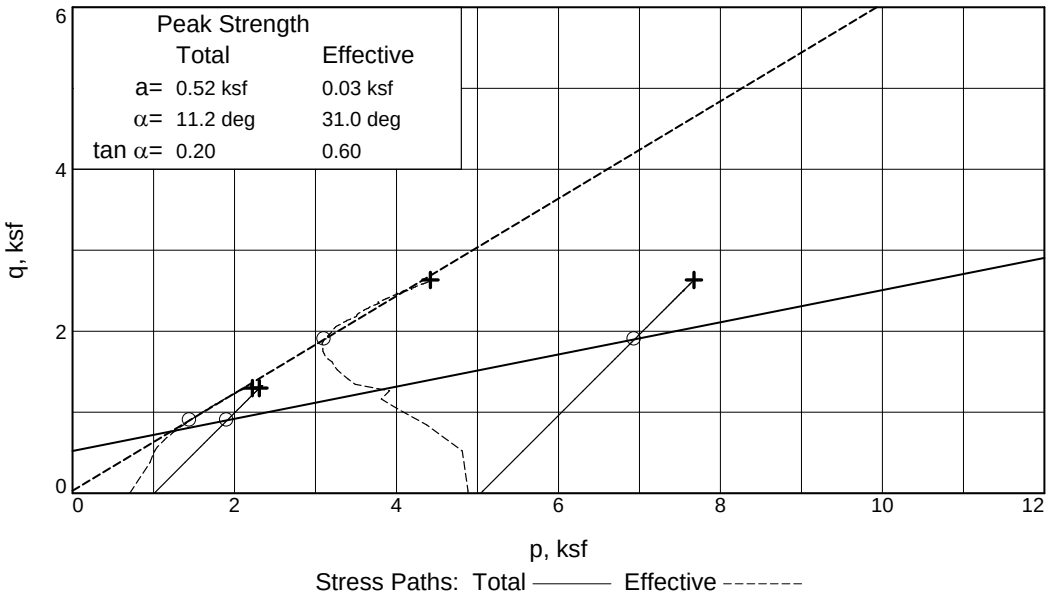
Sample Number: R-41 UD-1 **Depth:** 13.5-15 ft



Proj. No.: 1351-12-037 (01) **Date Sampled:** 2014-2015



TRIAXIAL SHEAR TEST REPORT
S & ME, INC.
Charlotte, North Carolina



Tested By: Karen Warner **Checked By:** N. Randy Rainwater 2/2/16

TRIAXIAL COMPRESSION TEST

2/2/2016

CU with Pore Pressures

3:29 PM

Date: 2014-2015
Client: STV
Project: SCDOT US 21 to SC 51
Project No.: 1351-12-037 (01)
Depth: 13.5-15 ft **Sample Number:** R-41 UD-1
Description: Red Brown Clay w/Medium to Fine Sand (CH) A-7-6
Remarks: The specimens failed in bulging. Only 2 specimens could be obtained from tube. ASTM D4767
Type of Sample: Undisturbed
Assumed Specific Gravity=2.65 **LL=**67 **PL=**25 **PI=**42
Test Method: COE uniform strain

Parameters for Specimen No. 1

Specimen Parameter	Initial	Saturated	Consolidated	Final
Moisture content: Moist soil+tare, gms.	145.520			1493.350
Moisture content: Dry soil+tare, gms.	136.260			1291.650
Moisture content: Tare, gms.	80.760			111.520
Moisture, %	16.7	16.6	13.9	17.1
Moist specimen weight, gms.	1367.05			
Diameter, in.	2.875	2.865	2.817	
Area, in.²	6.492	6.449	6.234	
Height, in.	6.042	6.022	5.922	
Net decrease in height, in.		0.020	0.100	
Wet density, pcf	132.8	134.0	137.7	
Dry density, pcf	113.8	114.9	120.9	
Void ratio	0.4539	0.4395	0.3684	
Saturation, %	97.4	100.0	100.0	

Test Readings for Specimen No. 1

Consolidation cell pressure = 77.00 psi (11.09 ksf)
Consolidation back pressure = 70.00 psi (10.08 ksf)
Consolidation effective confining stress = 1.01 ksf
Strain rate, in./min. = 0.004
Fail. Stress = 1.80 ksf **at reading no.** 15
Ult. Stress = 2.60 ksf **at reading no.** 109

Parameters for Specimen No. 2

Specimen Parameter	Initial	Saturated	Consolidated	Final
Moisture content: Moist soil+tare, gms.	266.220			1365.020
Moisture content: Dry soil+tare, gms.	224.030			1131.070
Moisture content: Tare, gms.	83.740			86.530
Moisture, %	30.1	26.5	23.4	22.4
Moist specimen weight, gms.	1273.06			
Diameter, in.	2.856	2.842	2.794	
Area, in.²	6.406	6.342	6.129	
Height, in.	6.015	5.985	5.885	
Net decrease in height, in.		0.030	0.100	
Wet density, pcf	125.9	124.3	127.5	
Dry density, pcf	96.8	98.2	103.4	
Void ratio	0.7420	0.7160	0.6307	
Saturation, %	109.4	100.0	100.0	

Test Readings for Specimen No. 2

Consolidation cell pressure = 105.00 psi (15.12 ksf)
Consolidation back pressure = 70.00 psi (10.08 ksf)
Consolidation effective confining stress = 5.04 ksf
Strain rate, in./min. = 0.004
Fail. Stress = 3.80 ksf **at reading no.** 22
Ult. Stress = 5.27 ksf **at reading no.** 104

Appendix VI – Culvert Memorandas

DocuSign Envelope ID: B78C5337-9AC5-4FD1-9516-EB260A554DE1

August 17, 2021

STV Incorporated
2430 Mall Drive, Suite 315 Building B
North Charleston, South Carolina 29406

Attention: Mr. Thomas Mastillone, P.E.

Reference: **Culvert Extensions at Station 33+80 and 41+06 – REV1**
US 21 and SC 51 Widening
York County, South Carolina
S&ME Project No. 1351-12-037

Dear Mr. Mastillone:

The purpose of this geotechnical memo is to provide design recommendations for the two above-referenced box culvert extensions. Authorization to proceed with this study was provided in general accordance with the Subcontract for Professional Services between STV Incorporated (STV) and S&ME dated November 27, 2012 and the First Amendment to Subcontract for Professional Services dated April 2014.

♦ Background

This project is a Pennies for Progress project that includes widening and realignment of approximately 2.9 miles of US 21 from SC Highway 460 (Springfield Parkway) to SC Highway 51 and SC Highway 51 from US 21 to the North Carolina and South Carolina border. The project site is located within York County, South Carolina. Culvert extension plan and section drawings (prepared by KCI Technologies (KCI) dated May 14, 2020) were provided by Ron Patton with STV on June 9, 2020. These plan and section drawings were subsequently provided to S&ME in Microstation format by Phil Leazer of KCI on June 10, 2020. In subsequent email correspondence, Thomas Mastillone provided PDF roadway plans dated March 18, 2021 that included culvert detail drawings prepared by KCI Technologies dated September 17, 2020.

The project includes adding a travel lane in each direction, adding a center turn lane, improvements to existing intersections and other impacted roadways. Two culverts will require extensions as a part of this project.

The existing 5-foot by 5-foot reinforced concrete box culvert located at approximate Station 33+80 will be extended in each direction. The cast-in-place culvert extension will have an upstream invert elevation of 565.64 feet and will have a downstream invert elevation of 561.77 feet. We have assumed that a minimum of 18 inches of #57 Stone for bedding will be placed under the culvert extension.

The existing 5-foot by 5-foot reinforced concrete box culvert located at approximate Station 41+06 will be extended in each direction. The cast-in-place culvert extension will have an upstream invert elevation of 568.48 feet and will have a downstream invert elevation of 565.32 feet. We have assumed that a minimum of 18 inches of #57 Stone for bedding will be placed under the culvert extension.

DocuSign Envelope ID: B78C5337-9AC5-4FD1-9516-EB260A554DE1

♦ Culvert Extension Exploration

The proposed culvert extension areas were previously explored during development of S&ME's *Preliminary Roadway Geotechnical Engineering Report (PRGER)* dated February 3, 2016. Several soil test borings, hand auger borings, and rod soundings were performed in the vicinity of the proposed culvert extension areas. In the vicinity of the Station 33+80 culvert extension, previous test locations include: HA-2/RS-2, HA-3/RS-3, R-4, R-34, R-35, R-36, S-2, and S-3. In the vicinity of the Station 41+06 culvert extension, previous test locations include: HA-4/RS-4, HA-5/RS-5, R-38, S-4, and S-5.

To supplement the previous exploration of the subgrade conditions at the culvert extensions, additional hand auger borings and rod soundings were conducted at each end of each of the two culvert extensions. Locations were determined in the field by S&ME personnel based on information provided by STV and KCI. Hand augers HA-102, HA-102A, and HA-103/RS-103 were performed at the Station 33+80 culvert extension. Hand augers HA-104/RS-104, HA-105, and HA-105A/RS-105A were performed at the 41+06 culvert extension.

The hand auger borings were advanced manually using a bucket-type hand auger. The soils encountered were classified by a staff professional from cuttings brought to the surface by the augering process and a field log of the encountered conditions was created. Following the water level measurements, the test locations were backfilled with auger cuttings.

Dynamic cone penetrometer (DCP) testing was conducted in the hand auger boreholes in general accordance with the procedure outlined in ASTM Special Technical Publication No. 399, Vane Shear and Cone Penetration Resistance Testing of In-Situ Soils. The dynamic cone penetrometer test was performed by driving an enlarged cone point into the soil using a 15-pound weight falling 20-inches sliding on a steel driving rod. The penetration testing was performed at various test depths in manually augered boreholes, each approximately 3-½ inches in diameter. After augering to each test depth, the cone point (45-degree apex angle, 1.5-inch diameter) was seated 2-inches into the undisturbed bottom of the borehole in order to embed the cone. The cone point was further driven 1-3/4 inches using the 15-pound weight falling 20-inches, and the number of hammer blows required to advance the point was recorded. The cone was typically advanced a total of three, 1-3/4 inch increments at each test depth, obtaining three dynamic penetration resistances. The blow count for each 1-3/4 inch increment provides a relative index to the soil strength and density/consistency. The resulting DCP blow count has been generally correlated for varying soil types and standard penetration resistance values in the above-noted reference.

Rod soundings are commonly used for supplementing traditional borings where access is limited or when hand auger boreholes cave in due to water inflow. The rod sounding consists of manually driving a 0.5-inch diameter steel rod into the ground with a standardized drop hammer while recording the number of blows required to penetrate two 6-inch increments. The total number of blows over the 1-foot penetration interval is referred to as a "blow count" in this report and provides a general indication of material consistency or relative density. The "blow count" is not the same as an SPT N-value and samples are not recovered for classification; therefore, strata and material types are inferred based on engineering judgement.

♦ Surface Conditions

Based on our site reconnaissance, the culvert extension areas are currently moderately to heavily wooded. At the time of our current exploration on June 19, 2020, the downstream culvert opening of the Station 33+80 culvert was completely submerged, and the upstream culvert opening was partially submerged. The depth of water flowing through the Station 41+06 culvert was relatively shallow.

DocuSign Envelope ID: B78C5337-9AC5-4FD1-9516-EB260A554DE1

♦ Subsurface Conditions

Culvert at 33+80

Soils along the Station 33+80 culvert extension were explored at test locations HA-2/RS-2, HA-3/RS-3, HA-102, HA-102A, and HA-103/RS-103. Borings R-4, R-34, R-35, R-36, S-2, and S-3 were performed in proximity to the existing culvert.

Subsurface conditions as indicated by the hand auger borings generally consist of topsoil underlain by alluvial soils and residual soils. The generalized subsurface conditions are described below. For more detailed soil descriptions and stratifications at a particular location, the respective hand auger log should be reviewed.

Topsoil: Hand auger borings HA-2 and HA-3 encountered 5 inches of topsoil at the ground surface.

Alluvial Soils: Alluvial soils were encountered underlying the surficial topsoil or at the existing ground surface in the hand auger borings and extended to depths of approximately 3.5 to 8.1 feet. The alluvial soils generally consisted of very soft silty clay and clay (USCS Classification CH), very soft to soft clayey silt (MH), very soft to stiff sandy clay and clay (CL), very loose clayey sand (SC), and very loose to loose silty sand (SM). The alluvial soils were noted as being wet to saturated. The soils encountered in HA-103 were noted as containing trace to few organics. HA-3 was terminated in alluvial soils at a depth of 8.1 feet. HA-102 and HA-103 were terminated in alluvial soils due to borehole cave-in at depths of 3.5 feet and 4 feet, respectively.

Residual Soils: Underlying the alluvial soils, residual soils were encountered in hand auger borings HA-2 and HA-102A. The residual soils generally consisted of stiff sandy silt (ML) and medium dense silty sand (SM). The residual soils were noted as being wet. HA-2 and HA-102A were terminated in residual soils. Hand auger refusal was encountered in HA-2 at a depth of 7.1 feet in the residual soils. HA-102A was terminated at a depth of 6.2 feet.

Water Levels: Groundwater level measurements were attempted at termination in each hand auger boring. Groundwater was encountered in each hand auger boring at depths ranging from approximately 1.2 to 2.8 feet (approximate elevations of 572.9 to 566.2 feet) below the existing ground surface.

Water levels tend to fluctuate with seasonal and climatic variations, as well as with some types of construction operations. Therefore, groundwater may be encountered during construction at depths not indicated by the borings.

Culvert at 41+06

Soils along the Station 41+06 culvert extension were explored at test locations HA-4/RS-4, HA-5/RS-5, HA-104/RS-104, HA-105, and HA-105A/RS-105A. Borings R-38, S-4, and S-5 were performed in proximity to the existing culvert.

Subsurface conditions as indicated by the hand auger borings generally consist of topsoil underlain by fill soils, alluvial soils and residual soils. The generalized subsurface conditions are described below. For more detailed soil descriptions and stratifications at a particular location, the respective hand auger log should be reviewed.

Topsoil: Hand auger boring HA-5 encountered 2 inches of topsoil at the existing ground surface.

DocuSign Envelope ID: B78C5337-9AC5-4FD1-9516-EB260A554DE1

Fill Soils: Fill soils were encountered underlying the surficial topsoil in HA-5 and extended to a depth of 1.7 feet below the existing ground surface. The fill soils generally consisted of sandy clay (CL). The fill soils were noted as being dry.

Alluvial Soils: Alluvial soils were encountered underlying the surficial topsoil or at the existing ground surface in the hand auger borings and extended to depths of approximately 3.6 to 6.5 feet. The alluvial soils generally consisted of very soft to firm silty clay (CH), firm sandy clay (CL), very loose to medium dense clayey sand (SC), and medium dense silty sand (SM). The alluvial soils were noted as being moist to saturated. The soils encountered in HA-4 were noted as containing trace of trash consisting of a plastic bag. HA-4 and HA-5 were terminated in alluvial soils at depths of 6.1 and 3.8 feet, respectively, upon encountering hand auger refusal. HA-104 and HA-105A were terminated in alluvial soils due to borehole cave-in at depths of 6.5 and 0.5 feet, respectively.

Residual Soils: Residual soils were encountered in hand auger boring HA-105 at the existing ground surface. The residual soils generally consisted of very soft to firm sandy clay (CL). The residual soils were noted as being moist. HA-105 was terminated in residual soils at a depth of 4 feet.

Water Levels: Groundwater level measurements were attempted at termination in each hand auger boring. Groundwater was encountered in most of the hand auger borings at depths ranging from approximately 0.25 to 2.9 feet (approximate elevations of 571.1 to 567.2 feet) below the existing ground surface.

Water levels tend to fluctuate with seasonal and climatic variations, as well as with some types of construction operations. Therefore, groundwater may be encountered during construction at depths not indicated by the borings.

♦ Recommendations

Bearing Resistance

Based on the stratigraphy encountered in the borings performed at the culvert extensions, recommended maximum values of nominal (q_n) and factored (q_R) bearing resistance at the service and strength limit states for the culvert are presented in the table below. The culvert located at Station 33+80 will bear about 7 to 9 feet below the existing ground surface on medium dense and hard residual soils. The culvert located at Station 41+06 will bear about 6 to 8 feet below the existing ground surface on loose residual soils and firm alluvial soils.

DocuSign Envelope ID: B78C5337-9AC5-4FD1-9516-EB260A554DE1

Table 1 – Bearing Resistance for Culvert

Structure	Offset (ft)	Approximate Bearing Elevation (ft)	Bearing Material	Limit State	Nominal Bearing Resistance, q_n (ksf)	Factored Bearing Resistance, q_R (ksf)
33+80 5x5′ Culvert Extension	102.6 LT	560.0	Sandy Silt (ML)	Service	11.2	5.0
				Extreme	2.9	2.9
	98.8 RT	563.5	Silty Sand (SM)	Service	6.4	2.9
				Extreme	1.3	1.3
41+06 5x5′ Culvert Extension	92.1 LT	563.5	Silty Clay (CH)	Service	5.5	2.5
				Extreme	2.8	2.8
	102.0 RT	566.5	Silty Sand (SM)	Service	6.5	2.9
				Extreme	1.4	1.4

Note: Resistance Factor (φ_b) used for Service and Extreme Limit States are 0.45 and 1.00, respectively. (Table 9-1, Chapter 9 of the SCDOT GDM)

Settlement Potential

As previously mentioned, the existing 5-foot by 5-foot reinforced concrete box culvert located at approximate Station 33+80 will be extended in each direction. Additional fill heights on the order of 27 feet are planned to widen the existing roadway. Total settlements anticipated for the culvert extensions range from about ¼ inch near the ends of the extensions at the proposed embankment toes, to about ½ inch at the point where the extensions connect to the existing culvert. Differential settlement inferred from these values would be approximately ¼ inch over a distance of approximately 50 feet for the western extension and approximately 43 feet for the eastern extension, resulting in angular distortions of the culvert of approximately 1/2400 for the western extension, and 1/2000 for the eastern extension. Settlements are anticipated to occur during construction of the extensions and embankment widening.

The existing 5-foot by 5-foot reinforced concrete box culvert located at approximate Station 41+06 will be extended in each direction. Additional fill heights on the order of 16 feet are planned to widen the existing roadway. Total settlements anticipated for the western culvert extension range from about ¼ inch near the end of the western extension at the proposed embankment toe, to about 1/10 of an inch at the point where the extension connects to the existing culvert. Differential settlement inferred from these values would be approximately 0.15 inches over a distance of approximately 73 feet, resulting in an angular distortion of the culvert of approximately 1/5800 for the western extension. Total settlements anticipated for the eastern culvert extension range from about 0.15 inches near the end of the eastern extension at the proposed embankment toe, to less than 1/10 of an inch at the point where the extension connects to the existing culvert. Differential settlement inferred from these values would be approximately 1/10 of an inch over a distance of approximately 111 feet, resulting in an angular distortion of the culvert of approximately 1/13000 for the eastern extension. Settlements are anticipated to occur during construction of the extensions and embankment widening.

Soft, saturated alluvial soils should be mucked out where they occur below the culvert extensions. No. 57 Stone should be used to backfill muck excavation. The depth of undercut shall be extended to a suitable bearing material.

DocuSign Envelope ID: B78C5337-9AC5-4FD1-9516-EB260A554DE1

Based on Section 10.1 of the SCDOT Geotechnical Design Manual, "no performance objectives or limits have been established for hydraulic structures (i.e., culverts and pipes). The acceptable performance of a hydraulic structure is based on the integrity of the structure and the ability of the structure to continue to function as designed (i.e., convey water from one side of the embankment to the other). Therefore, the GEOR shall report anticipated deformations (i.e., total and differential settlement, etc.) to both the SEOR as well as the HEOR. It is the responsibility of these designers (i.e., SEOR and HEOR) to determine if the hydraulic structure will perform as designed given the anticipated deformations."

Sliding Resistance

The factored resistance against failure by sliding (R_R) should be determined using Eq. 10.6.3.4-1 of the current AASHTO LRFD Bridge Design Specifications.

For headwall foundations bearing 2 feet or more below final grades, the nominal sliding resistance (R_τ) between the soil and the shallow spread culvert headwall foundation should be taken as the total vertical force (V) acting on the foundation multiplied by the recommended coefficient of friction (tan δ). For the Station 33+80 culvert inlet and outlet headwall foundations, tan δ is recommended to be 0.53. For the Station 41+06 culvert inlet headwall foundations, tan δ is recommended to be 0.53. For the Station 41+06 culvert outlet headwall foundations, the recommended unit sliding resistance is 1 kip per square foot (ksf). If the headwall foundations are precast concrete units, the factored sliding resistance may then be determined by applying a resistance factor of 0.8 to the nominal value for shearing between the footing and granular soil.

Excavations

Partially weathered rock and auger refusal material were encountered in the soil test borings performed in the vicinity of the proposed culvert extension areas. These borings were presented in S&ME's *Preliminary Roadway Geotechnical Engineering Report (PRGER)* dated February 3, 2016. Based on the borings and the culvert extension invert elevations, excavation into PWR and/or rock may be required during construction of the culvert extensions.

Excavatable PWR is defined as material that can excavated using traditional equipment by first loosening with a single tooth ripper attached to a suitable sized dozer, such as a Caterpillar D-8 or D-9, or suitable sized trackhoe such as a Caterpillar C320 equipped with a rock bucket with a curling force of 18,300 pounds or greater.

Jack hammering or blasting may be required for PWR in trench excavations, below the upper 2-4 feet of PWR in open excavations, and for rock in both open site (greater than 10 feet wide and 30 feet long) and trench excavations. We anticipate blasting will not be allowed to due to the close proximity of the roadways.

Jack hammering or blasting of rock may result in an uneven rock surface in the bottom of trench excavations and a subsequent point load condition on the culvert. If dissimilar bearing conditions exist in excavations, we recommend that those conditions be evaluated on a case-by-case basis. To provide a uniform bearing surface and reduce the potential for point loading, over-excavation below the bearing elevation and replacement with properly compacted low-plasticity granular soil, crushed stone, or lean concrete may be required.

The depth to, and thickness of, PWR, rock lenses or seams and bedrock, can vary dramatically in short distances and between boring locations; therefore, PWR, boulders or bedrock may be encountered during any excavation on this project.

DocuSign Envelope ID: B78C5337-9AC5-4FD1-9516-EB260A554DE1

Controlled Fill

Fill material proposed for the project should be in general accordance with SCDOT Standard Specifications for borrow in Section 203.2.1.8. York County lies in Group A as defined in that section, and would require AASHTO soils A-1, A-2, A-3, A-4, A-5, or A-6 be used for borrow material within the top 5 feet of the embankment. Below the top 5 feet other soils (besides muck) can be used as long as they are stable when compacted to the required density.

Fill placement and compaction should be in general accordance with the SCDOT Standard Specifications for Highway Construction 2007 edition, Division 205 Embankment Construction and any applicable project specifications or provisions. In-place density testing should be performed by an experienced engineering technician to confirm that the contractor's compaction method can achieve the specified compaction and that the fill material meets the specified requirements. Fill subgrade evaluations and proofrolling and subgrade repair and/or undercutting operations should be observed by a representative of the geotechnical engineer or an experienced engineering technician.

♦ Recommended Notes on Plans

S&ME recommends the following notes be included on the plans specific to the culvert extensions:

- A minimum of 18 inches of #57 Stone for bedding shall be placed under the culvert extensions, and a non-woven geotextile shall be placed so that the 57 Stone is separated on all sides from the surrounding and underlying soils.
- If conditions are encountered that require mucking or undercutting use No. 57 stone as borrow material. The depth to which mucking or undercutting is required is dependent upon encountering a suitable bearing material within the excavation as determined by the Geotechnical Engineer of Record. When using No. 57 Stone to backfill undercut areas, use a non-woven geotextile to separate the No. 57 Stone from the surrounding soils. If muck excavation is required, refer to the Supplemental Specification for Muck Excavation.
- Based on the borings and the culvert extension invert elevations, excavation into PWR and/or rock may be required during construction of the culvert extensions. Excavation into PWR and/or rock should be anticipated for the Station 33+80 culvert upstream and downstream extensions. Excavation into PWR and/or rock should be anticipated for the Station 41+06 culvert upstream extension.

♦ Limitations

This report has been prepared in accordance with generally accepted geotechnical engineering practice for specific application to this project. The conclusions and recommendations in this report are based on the applicable standards of our practice in this geographic area at the time this report was prepared. No other warranty, express or implied, is made.

The nature and extent of variations between the borings will not become evident until construction. If variations appear evident, then we will need to re-evaluate the recommendations of this report. In the event that any changes in the nature, design, or location of the structures are planned, the conclusions and recommendations contained in this report will not be considered valid unless the changes are reviewed and conclusions modified or verified in writing by the submitting engineers.

Ultimate Bearing Capacity Determination

AASHTO LRFD Method

NOTES:
- nominal bearing resistance (capacity) of spread footings on cohesionless soils shall be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- nominal bearing resistance (capacity) of spread footings on cohesive soils shall be evaulated for **total stress** analyses and **undrained** soil strength parameters.
- in cases where the cohesive soils may soften and lose strength with time, then these soils should be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- for footings bearing on fill, the nominal bearing resistance (capacity) shall be evaluated using the **more critical of either total or effective strength** analyses.

GENERAL EQUATION: $q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B N_{\gamma m} C_{w\gamma}$

IN WHICH: $N_{cm} = N_c s_c i_c$

$N_{qm} = N_q s_q d_q i_q$

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

WHERE: c = cohesion, taken as undrained shear strength (ksf)

N_c = cohesion term (undrained loading) bearing capacity factor as specified in Table 1 (dim.)

N_q = surcharge (embedment) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

N_γ = unit weight (footing width) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

γ = total (moist) unit weight of soil above ofr below the bearing depth of the footing (kcf)

D_f = footing embedment depth (ft.)

B = footing width (ft.)

$C_{wq}, C_{w\gamma}$ = correction factors to account for the location of the ground water table as specified in Table 2 (dim.)

s_c, s_γ, s_q = footing shape correction factors as specified in Table 3 (dim.)

d_q = correction factor to account for the shearing resistance along the failure surface passing through cohesionless material above the bearing elevation as specified in Table 4 (dim.)

i_c, i_γ, i_q = load inclination factors - for footings with modest embedment, consideration may be given to omission of the load inclination factors

i.e. S&ME will assume all inclination factors = 1

TABLE 1
Bearing Capacity Factors

ϕ	N_c	N_q	N_γ

Ultimate Bearing Capacity Determination

AASHTO LRFD Method

NOTES:
- nominal bearing resistance (capacity) of spread footings on cohesionless soils shall be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- nominal bearing resistance (capacity) of spread footings on cohesive soils shall be evaulated for **total stress** analyses and **undrained** soil strength parameters.
- in cases where the cohesive soils may soften and lose strength with time, then these soils should be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- for footings bearing on fill, the nominal bearing resistance (capacity) shall be evaluated using the **more critical of either total or effective strength** analyses.

GENERAL EQUATION: $q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B N_{\gamma m} C_{w\gamma}$

IN WHICH: $N_{cm} = N_c s_c i_c$

$N_{qm} = N_q s_q d_q i_q$

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

WHERE: c = cohesion, taken as undrained shear strength (ksf)

N_c = cohesion term (undrained loading) bearing capacity factor as specified in Table 1 (dim.)

N_q = surcharge (embedment) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

N_γ = unit weight (footing width) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

γ = total (moist) unit weight of soil above ofr below the bearing depth of the footing (kcf)

D_f = footing embedment depth (ft.)

B = footing width (ft.)

$C_{wq}, C_{w\gamma}$ = correction factors to account for the location of the ground water table as specified in Table 2 (dim.)

s_c, s_γ, s_q = footing shape correction factors as specified in Table 3 (dim.)

d_q = correction factor to account for the shearing resistance along the failure surface passing through cohesionless material above the bearing elevation as specified in Table 4 (dim.)

i_c, i_γ, i_q = load inclination factors - for footings with modest embedment, consideration may be given to omission of the load inclination factors

i.e. S&ME will assume all inclination factors = 1

Ultimate Bearing Capacity Determination

AASHTO LRFD Method

NOTES:
- nominal bearing resistance (capacity) of spread footings on cohesionless soils shall be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- nominal bearing resistance (capacity) of spread footings on cohesive soils shall be evaulated for **total stress** analyses and **undrained** soil strength parameters.
- in cases where the cohesive soils may soften and lose strength with time, then these soils should be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- for footings bearing on fill, the nominal bearing resistance (capacity) shall be evaluated using the **more critical of either total or effective strength** analyses.

GENERAL EQUATION: $q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B N_{\gamma m} C_{w\gamma}$

IN WHICH: $N_{cm} = N_c s_c i_c$

$N_{qm} = N_q s_q d_q i_q$

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

WHERE: c = cohesion, taken as undrained shear strength (ksf)

N_c = cohesion term (undrained loading) bearing capacity factor as specified in Table 1 (dim.)

N_q = surcharge (embedment) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

N_γ = unit weight (footing width) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

γ = total (moist) unit weight of soil above ofr below the bearing depth of the footing (kcf)

D_f = footing embedment depth (ft.)

B = footing width (ft.)

$C_{wq}, C_{w\gamma}$ = correction factors to account for the location of the ground water table as specified in Table 2 (dim.)

s_c, s_γ, s_q = footing shape correction factors as specified in Table 3 (dim.)

d_q = correction factor to account for the shearing resistance along the failure surface passing through cohesionless material above the bearing elevation as specified in Table 4 (dim.)

i_c, i_γ, i_q = load inclination factors - for footings with modest embedment, consideration may be given to omission of the load inclination factors

i.e. S&ME will assume all inclination factors = 1

Ultimate Bearing Capacity Determination

AASHTO LRFD Method

NOTES:
- nominal bearing resistance (capacity) of spread footings on cohesionless soils shall be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- nominal bearing resistance (capacity) of spread footings on cohesive soils shall be evaulated for **total stress** analyses and **undrained** soil strength parameters.
- in cases where the cohesive soils may soften and lose strength with time, then these soils should be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- for footings bearing on fill, the nominal bearing resistance (capacity) shall be evaluated using the **more critical of either total or effective strength** analyses.

GENERAL EQUATION: $q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B N_{\gamma m} C_{w\gamma}$

IN WHICH: $N_{cm} = N_c s_c i_c$

$N_{qm} = N_q s_q d_q i_q$

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

WHERE: c = cohesion, taken as undrained shear strength (ksf)

N_c = cohesion term (undrained loading) bearing capacity factor as specified in Table 1 (dim.)

N_q = surcharge (embedment) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

N_γ = unit weight (footing width) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

γ = total (moist) unit weight of soil above ofr below the bearing depth of the footing (kcf)

D_f = footing embedment depth (ft.)

B = footing width (ft.)

$C_{wq}, C_{w\gamma}$ = correction factors to account for the location of the ground water table as specified in Table 2 (dim.)

s_c, s_γ, s_q = footing shape correction factors as specified in Table 3 (dim.)

d_q = correction factor to account for the shearing resistance along the failure surface passing through cohesionless material above the bearing elevation as specified in Table 4 (dim.)

i_c, i_γ, i_q = load inclination factors - for footings with modest embedment, consideration may be given to omission of the load inclination factors

i.e. S&ME will assume all inclination factors = 1

LRFD SLIDING PARAMETERS

Inlet Headwall:

Reference Boring: HA-102A

D_f = 2 ft below existing grade, bearing in: Gravel with Sand and Silt (A-2-4)

For Cohesionless Soils (i.e. $\phi_f > 0$):

N = 11 bpf

ϕ_f = 28 degrees

Coefficient of Friction = tan δ

= tan(ϕ_f) for concrete cast against soil

= 0.8 tan(ϕ_f) for precast concrete footing

FootingType: Cast-in-Place

tan δ = tan (28)

tan δ = **0.53**

For Cohesive Soils (i.e. $\phi_f = 0$):

q_u = N/A tsf

S_u = N/A ksf

For Gravel with Sand and Silt (A-2-4) soil, the unit sliding resistance equals the undrained shear strength (Su)

Therefore, sliding resistance = **N/A** ksf

Outlet Headwall:

Reference Boring: S-3

D_f = 2 ft below existing grade, bearing in: Sandy Silt (A-4a)

For Cohesionless Soils (i.e. $\phi_f > 0$):

N = 47 bpf

ϕ_f = 28 degrees

Coefficient of Friction = tan δ

tan(ϕ_f) for concrete cast against soil

0.8 tan(ϕ_f) for precast concrete footing

Footing Type: Cast-in-Place

tan δ = tan (28)

tan δ = **0.53**

For Cohesive Soils (i.e. $\phi_f = 0$):

q_u = N/A tsf

S_u = 0 ksf

For Sandy Silt (A-4a) soil, the unit sliding resistance equals the undrained shear strength (Su)

Therefore, sliding resistance = **N/A** ksf

10.6.3.4 Failure by Sliding

SCDOT GDM

August 6, 2021

STV Incorporated
2430 Mall Drive, Suite 315 Building B
North Charleston, South Carolina 29406

Attention: Mr. Thomas Mastillone, P.E.

Reference: **Culvert Extension at SC 51 Station 316+23 – REV1**
US 21 and SC 51 Widening
York County, South Carolina
S&ME Project No. 1351-12-037

Dear Mr. Mastillone:

The purpose of this geotechnical memo is to provide design recommendations for the above-referenced box culvert extension. Authorization to proceed with this study was provided in general accordance with the Subcontract for Professional Services between STV Incorporated (STV) and S&ME dated November 27, 2012 and the First Amendment to Subcontract for Professional Services dated April 2014.

♦ Background

This project is a Pennies for Progress project that includes widening and realignment of approximately 2.9 miles of US 21 from SC Highway 460 (Springfield Parkway) to SC Highway 51 and SC Highway 51 from US 21 to the North Carolina and South Carolina border. The project site is located within York County, South Carolina. A culvert profile drawing in PDF format (prepared by STV dated October 26, 2020), along with a zip file containing various roadway design files in Microstation and PDF formats, were provided by Thomas Mastillone with STV on October 26, 2020. In subsequent email correspondence, Thomas Mastillone provided PDF roadway plans dated March 18, 2021 that included culvert detail drawings prepared by KCI Technologies dated May 2019.

The project includes adding a travel lane in each direction, adding a center turn lane, improvements to existing intersections and other impacted roadways. Three culverts will require extensions as a part of this project. Design recommendations for the two culvert extensions along the US 21 alignment were provided in a separate memo.

The existing 6-foot by 6-foot reinforced concrete box culvert located along SC 51 at approximate Station 316+23 will be extended in each direction. The cast-in-place culvert extension will have an upstream invert elevation of 591.47 feet and will have a downstream invert elevation of 589.08 feet. We have assumed that a minimum of 18 inches of #57 Stone for bedding will be placed under the culvert extension.

♦ Culvert Extension Exploration

The proposed culvert extension area was not explored during development of S&ME's *Preliminary Roadway Geotechnical Engineering Report (PRGER)* dated February 3, 2016, although two soil test borings (R-27 and R-28) were performed nearby.

In order to explore the subgrade conditions at the culvert extension, hand auger borings were conducted at each of the four corners of each side of the culvert extension. Locations were determined in the field by S&ME personnel based on information provided by STV. Hand augers HA-201 through HA-208 were performed at the SC 51 Station 316+23 culvert extension.

The hand auger borings were advanced manually using a bucket-type hand auger. The soils encountered were classified by a staff professional from cuttings brought to the surface by the augering process and a field log of the encountered conditions was created. Following the water level measurements, the test locations were backfilled with auger cuttings.

Dynamic cone penetrometer (DCP) testing was conducted in the hand auger boreholes in general accordance with the procedure outlined in ASTM Special Technical Publication No. 399, Vane Shear and Cone Penetration Resistance Testing of In-Situ Soils. The dynamic cone penetrometer test was performed by driving an enlarged cone point into the soil using a 15-pound weight falling 20-inches sliding on a steel driving rod. The penetration testing was performed at various test depths in manually augered boreholes, each approximately 3-½ inches in diameter. After augering to each test depth, the cone point (45-degree apex angle, 1.5-inch diameter) was seated 2-inches into the undisturbed bottom of the borehole in order to embed the cone. The cone point was further driven 1-3/4 inches using the 15-pound weight falling 20-inches, and the number of hammer blows required to advance the point was recorded. The cone was typically advanced a total of three, 1-3/4 inch increments at each test depth, obtaining three dynamic penetration resistances. The blow count for each 1-3/4 inch increment provides a relative index to the soil strength and density/consistency. The resulting DCP blow count has been generally correlated for varying soil types and standard penetration resistance values in the above-noted reference.

♦ Surface Conditions

Based on our site reconnaissance, the culvert extension areas are currently partially covered in low brush and partially wooded. At the time of our current exploration on November 11, 2020, the depth of water flowing through the culvert was relatively shallow.

♦ Subsurface Conditions

Soils along the SC 51 Station 316+23 culvert extension were explored at test locations HA-201 through HA-208.

Subsurface conditions as indicated by the hand auger borings generally consist of fill soils, alluvial soils and residual soils. The generalized subsurface conditions are described below. For more detailed soil descriptions and stratifications at a particular location, the respective hand auger log should be reviewed.

Fill Soils: Fill soils were encountered at the existing ground surface in each of the hand auger borings and extended to depths of 1 to 2 feet below the existing ground surface. The fill soils generally consisted of soft silty clay (USCS Classification CH), soft clayey silt (MH), soft to firm sandy clay (CL), soft sandy silt (ML), loose clayey sand (SC), and loose silty sand (SM). The fill soils were noted as being dry to wet. The fill soils encountered in HA-203 contained trace organic matter consisting of roots.

Alluvial Soils: Alluvial soils were encountered underlying the fill soils in hand auger borings HA-202 through HA-207 and extended to depths of approximately 3 to 5.5 feet. The alluvial soils generally consisted of very soft to stiff silty clay (CH), soft sandy clay (CL), loose clayey sand (SC), and loose silty sand (SM). The alluvial soils were

noted as being moist to saturated. Some of the alluvial soils encountered in HA-206 and HA-207 contained trace organic matter consisting of roots.

Residual Soils: Residual soils were encountered in each of the hand auger borings underlying the fill soils or the alluvial soils. The residual soils generally consisted of firm to stiff silty clay (CH), firm to stiff sandy clay (CL), firm to stiff sandy silt (ML), loose to medium dense clayey sand (SC), and very loose to medium dense silty sand (SM). The residual soils were noted as being moist to saturated. Each of the hand auger borings were terminated in residual soils at depths ranging from 5 to 9 feet.

Hand Auger Refusal: Hand auger refusal was encountered in HA-202, HA-205, HA-206, and HA-207 at depths ranging from 5 to 8 feet (approximate elevations of 584.6 feet to 588.8 feet). Hand auger refusal could be due to the presence of high consistency/relative density soils, partially weathered rock, or rock.

Water Levels: Groundwater level measurements were attempted at termination in each hand auger boring. Groundwater was encountered in HA-201, HA-202, HA-203, HA-206, and HA-207 at depths ranging from approximately 2.5 to 7 feet (approximate elevations of 588.1 to 589.7 feet) below the existing ground surface.

Water levels tend to fluctuate with seasonal and climatic variations, as well as with some types of construction operations. Therefore, groundwater may be encountered during construction at depths not indicated by the borings.

♦ Recommendations

Bearing Resistance

Based on the stratigraphy encountered in the borings performed at the culvert extension, recommended maximum values of nominal (q_n) and factored (q_R) bearing resistance at the strength and extreme limit states for the culvert are presented in the table below. The culvert located at Station 316+23 will bear about 5 to 7 feet below the existing ground surface on medium dense and firm residual soils.

Table 1 – Bearing Resistance for Culvert

Structure	Offset (ft)	Approximate Bearing Elevation (ft)	Bearing Material	Limit State	Nominal Bearing Resistance, q_n (ksf)	Factored Bearing Resistance, q_R (ksf)
316+23 6'x6' Box Culvert Extension	LT	588.7 to 586.9	Silty Sand (SM) and Sandy Silt (ML)	Strength	7.9	3.6
				Extreme	7.9	7.9
	RT	586.8 to 586.6	Clayey Sand (SC) and Silty Sand (SM)	Strength	8.0	3.6
				Extreme	8.0	8.0

Note: Resistance Factor (φ_b) used for Strength and Extreme Limit States are 0.45 and 1.00, respectively. (Table 9-1, Chapter 9 of the SCDOT GDM)

Settlement Potential

As previously mentioned, the existing 6-foot by 6-foot reinforced concrete box culvert located at approximate Station 316+23 will be extended in each direction. Additional fill heights on the order of 6 to 8 feet are planned to widen the existing roadway. Total settlements anticipated for the culvert extensions range from about 0.15 inches near the ends of the extensions (near the proposed embankment toes), up to about 0.3 inches along the lengths of the culvert extensions, and about 0.2 inches at the point where the extensions connect to the existing culvert. Differential settlement inferred from these values are approximately 1/10 of an inch over a distance of approximately 20 feet and approximately 0.15 inches over a distance of approximately 30 feet, resulting in angular distortions of the culvert extensions of approximately 1/2400. Settlements are anticipated to occur during construction of the extensions and embankment widening.

Soft, saturated soils, if encountered, should be mucked out where they occur below the culvert extensions. No. 57 Stone should be used to backfill muck excavation. The depth of undercut shall be extended to a suitable bearing material.

Based on Section 10.1 of the SCDOT Geotechnical Design Manual, "no performance objectives or limits have been established for hydraulic structures (i.e., culverts and pipes). The acceptable performance of a hydraulic structure is based on the integrity of the structure and the ability of the structure to continue to function as designed (i.e., convey water from one side of the embankment to the other). Therefore, the GEOR shall report anticipated deformations (i.e., total and differential settlement, etc.) to both the SEOR as well as the HEOR. It is the responsibility of these designers (i.e., SEOR and HEOR) to determine if the hydraulic structure will perform as designed given the anticipated deformations."

Sliding Resistance

The factored resistance against failure by sliding (R_R) should be determined using Eq. 10.6.3.4-1 of the current AASHTO LRFD Bridge Design Specifications.

For headwall foundations bearing 2.5 feet or more below final grades, the nominal sliding resistance (R_τ) between the soil and the shallow spread culvert headwall foundation should be taken as the total vertical force (V) acting on the foundation multiplied by the recommended coefficient of friction (tan δ). For the Station 316+23 culvert

inlet and outlet headwall foundations, tan δ is recommended to be 0.53. If the headwall foundations are precast concrete units, the factored sliding resistance may then be determined by applying a resistance factor of 0.8 to the nominal value for shearing between the footing and granular soil.

Excavations

As previously mentioned, hand auger refusal was encountered in HA-202, HA-205, HA-206, and HA-207 at depths ranging from 5 to 8 feet (approximate elevations of 584.6 feet to 588.8 feet). Hand auger refusal could be due to the presence of high consistency/relative density soils, partially weathered rock, or rock. As previously mentioned, two soil test borings (R-27 and R-28) were performed near the proposed culvert extension area. These borings were presented in S&ME's *Preliminary Roadway Geotechnical Engineering Report (PRGER)* dated February 3, 2016. Partially weathered rock was first encountered in R-28 at an approximate depth of 4.3 feet (approximate elevation of 595.7 feet). Auger refusal material was encountered in R-27 at an approximate depth of 10.9 feet (approximate elevation of 593.1 feet). Based on the borings and the culvert extension invert elevations, excavation into PWR and/or rock may be required during construction of the culvert extensions.

Excavatable PWR is defined as material that can be excavated using traditional equipment by first loosening with a single tooth ripper attached to a suitable sized dozer, such as a Caterpillar D-8 or D-9, or suitable sized trackhoe such as a Caterpillar C320 equipped with a rock bucket with a curling force of 18,300 pounds or greater.

Jack hammering or blasting may be required for PWR in trench excavations, below the upper 2-4 feet of PWR in open excavations, and for rock in both open site (greater than 10 feet wide and 30 feet long) and trench excavations. We anticipate blasting will not be allowed to due to the close proximity of the existing roadway.

Jack hammering or blasting of rock may result in an uneven rock surface in the bottom of trench excavations and a subsequent point load condition on the culvert. If dissimilar bearing conditions exist in excavations, we recommend that those conditions be evaluated on a case-by-case basis. To provide a uniform bearing surface and reduce the potential for point loading, over-excavation below the bearing elevation and replacement with properly compacted low-plasticity granular soil, crushed stone, or lean concrete may be required.

The depth to, and thickness of, PWR, rock lenses or seams and bedrock, can vary dramatically in short distances and between boring locations; therefore, PWR, boulders or bedrock may be encountered during any excavation on this project.

Controlled Fill

Fill material proposed for the project should be in general accordance with SCDOT Standard Specifications for borrow in Section 203.2.1.8. York County lies in Group A as defined in that section, and would require AASHTO soils A-1, A-2, A-3, A-4, A-5, or A-6 be used for borrow material within the top 5 feet of the embankment. Below the top 5 feet other soils (besides muck) can be used as long as they are stable when compacted to the required density.

Fill placement and compaction should be in general accordance with the SCDOT Standard Specifications for Highway Construction 2007 edition, Division 205 Embankment Construction and any applicable project specifications or provisions. In-place density testing should be performed by an experienced engineering technician to confirm that the contractor's compaction method can achieve the specified compaction and that the fill material meets the specified requirements. Fill subgrade evaluations and proofrolling and subgrade repair and/or undercutting operations should be observed by a representative of the geotechnical engineer or an experienced engineering technician.

Recommended Notes on Plans

S&ME recommends the following notes be included on the plans specific to the culvert extensions:

- A minimum of 18 inches of #57 Stone for bedding shall be placed under the culvert extension, and a non-woven geotextile shall be placed so that the 57 Stone is separated on all sides from the surrounding and underlying soils.
- If conditions are encountered that require mucking or undercutting use No. 57 stone as borrow material. The depth to which mucking or undercutting is required is dependent upon encountering a suitable bearing material within the excavation as determined by the Geotechnical Engineer of Record. When using No. 57 Stone to backfill undercut areas, use a non-woven geotextile to separate the No. 57 Stone from the surrounding soils. If muck excavation is required, refer to the Supplemental Specification for Muck Excavation.
- Based on the borings and the culvert extension invert elevations, excavation into PWR and/or rock may be required during construction of the culvert extensions.

Limitations

This report has been prepared in accordance with generally accepted geotechnical engineering practice for specific application to this project. The conclusions and recommendations in this report are based on the applicable standards of our practice in this geographic area at the time this report was prepared. No other warranty, express or implied, is made.

The nature and extent of variations between the borings will not become evident until construction. If variations appear evident, then we will need to re-evaluate the recommendations of this report. In the event that any changes in the nature, design, or location of the structures are planned, the conclusions and recommendations contained in this report will not be considered valid unless the changes are reviewed and conclusions modified or verified in writing by the submitting engineers.

Closure

S&ME, Inc. appreciates the opportunity to assist you during this phase of the project. If you should have questions concerning this report, or if we may be of further assistance, please contact us.

Sincerely,

S&ME, Inc.

Ultimate Bearing Capacity Determination

AASHTO LRFD Method

NOTES:
- nominal bearing resistance (capacity) of spread footings on cohesionless soils shall be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- nominal bearing resistance (capacity) of spread footings on cohesive soils shall be evaulated for **total stress** analyses and **undrained** soil strength parameters.
- in cases where the cohesive soils may soften and lose strength with time, then these soils should be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- for footings bearing on fill, the nominal bearing resistance (capacity) shall be evaluated using the **more critical of either total or effective strength** analyses.

GENERAL EQUATION: $q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B N_{\gamma m} C_{w\gamma}$

IN WHICH: $N_{cm} = N_c s_c i_c$

$N_{qm} = N_q s_q d_q i_q$

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

WHERE: c = cohesion, taken as undrained shear strength (ksf)

N_c = cohesion term (undrained loading) bearing capacity factor as specified in Table 1 (dim.)

N_q = surcharge (embedment) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

N_γ = unit weight (footing width) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

γ = total (moist) unit weight of soil above or below the bearing depth of the footing (kcf)

D_f = footing embedment depth (ft.)

B = footing width (ft.)

$C_{wq}, C_{w\gamma}$ = correction factors to account for the location of the ground water table as specified in Table 2 (dim.)

s_c, s_γ, s_q = footing shape correction factors as specified in Table 3 (dim.)

d_q = correction factor to account for the shearing resistance along the failure surface passing through cohesionless material above the bearing elevation as specified in Table 4 (dim.)

i_c, i_γ, i_q = load inclination factors - for footings with modest embedment, consideration may be given to omission of the load inclination factors

i.e. S&ME will assume all inclination factors = 1

Ultimate Bearing Capacity Determination

AASHTO LRFD Method

NOTES:
- nominal bearing resistance (capacity) of spread footings on cohesionless soils shall be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- nominal bearing resistance (capacity) of spread footings on cohesive soils shall be evaulated for **total stress** analyses and **undrained** soil strength parameters.
- in cases where the cohesive soils may soften and lose strength with time, then these soils should be evaluated using **effective stress** analyses and **drained** soil strength parameters.
- for footings bearing on fill, the nominal bearing resistance (capacity) shall be evaluated using the **more critical of either total or effective strength** analyses.

GENERAL EQUATION: $q_n = cN_{cm} + \gamma D_f N_{qm} C_{wq} + 0.5\gamma B N_{\gamma m} C_{w\gamma}$

IN WHICH: $N_{cm} = N_c s_c i_c$

$N_{qm} = N_q s_q d_q i_q$

$N_{\gamma m} = N_\gamma s_\gamma i_\gamma$

WHERE: c = cohesion, taken as undrained shear strength (ksf)

N_c = cohesion term (undrained loading) bearing capacity factor as specified in Table 1 (dim.)

N_q = surcharge (embedment) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

N_γ = unit weight (footing width) term (drained loading) bearing capacity factor as specified in Table 1 (dim.)

γ = total (moist) unit weight of soil above or below the bearing depth of the footing (kcf)

D_f = footing embedment depth (ft.)

B = footing width (ft.)

$C_{wq}, C_{w\gamma}$ = correction factors to account for the location of the ground water table as specified in Table 2 (dim.)

s_c, s_γ, s_q = footing shape correction factors as specified in Table 3 (dim.)

d_q = correction factor to account for the shearing resistance along the failure surface passing through cohesionless material above the bearing elevation as specified in Table 4 (dim.)

i_c, i_γ, i_q = load inclination factors - for footings with modest embedment, consideration may be given to omission of the load inclination factors

i.e. S&ME will assume all inclination factors = 1

LRFD SLIDING PARAMETERS

Inlet Headwall:

Reference Boring: HA-201

D_f = 2.5 ft below final grade, bearing in: Gravel with Sand and Silt (A-2-4)

For Cohesionless Soils (i.e. $\phi_f > 0$):

N = 14 bpf

ϕ_f = 28 degrees

Coefficient of Friction = tan δ
= tan(ϕ_f) for concrete cast against soil
= 0.8 tan(ϕ_f) for precast concrete footing

FootingType: Cast-in-Place

tan δ = tan (28)

tan δ = **0.53**

For Cohesive Soils (i.e. $\phi_f = 0$):

q_u = N/A tsf

S_u = N/A ksf

For Gravel with Sand and Silt (A-2-4) soil, the unit sliding resistance equals the undrained shear strength (Su)

Therefore, sliding resistance = **N/A** ksf

Outlet Headwall:

Reference Boring: HA-207

D_f = 2.5 ft below final grade, bearing in: Gravel with Sand and Silt (A-2-4)

For Cohesionless Soils (i.e. $\phi_f > 0$):

N = 14 bpf

ϕ_f = 28 degrees

Coefficient of Friction = tan δ
tan(ϕ_f) for concrete cast against soil
0.8 tan(ϕ_f) for precast concrete footing

Footing Type: Cast-in-Place

tan δ = tan (28)

tan δ = **0.53**

For Cohesive Soils (i.e. $\phi_f = 0$):

q_u = N/A tsf

S_u = N/A ksf

For Gravel with Sand and Silt (A-2-4) soil, the unit sliding resistance equals the undrained shear strength (Su)

Therefore, sliding resistance = **N/A** ksf

Attention: Mr. Thomas Mastillone, P.E.

Reference: **Final Roadway Geotechnical Engineering Report (RGER)**
Gold Hill Road Realignment from Forest Way Drive to US 21 Bypass
York County, South Carolina
S&ME Project No. 1351-12-037

Dear Mr. Mastillone:

The purpose of this final roadway geotechnical engineering report (RGER) is to provide information that may be used in design of the roadway embankments associated with the Gold Hill Road realignment portion of the overall project consisting of widening US 21 Bypass and SC 51 from Springfield Parkway to the North Carolina Line in Fort Mill, York County, South Carolina. Our services were performed in general accordance with the subcontract between STV, Inc. (STV) and S&ME, Inc. dated November 27, 2012, and subsequent Amendment 2, dated December 2021. The attached report presents our understanding of the project requirements and provides our recommendations in general accordance with Chapter 21.4.2 the SCDOT Geotechnical Design Manual (GDM), Version 2.0, January 2019. The recommendations herein exclude other roadway alignments associated with this project, culverts, and pavements which were addressed under separate cover.

Sincerely,

S&ME, Inc.

1.0 Introduction

This report summarizes the results of the geotechnical investigation conducted to date for the Gold Hill Road (S-1726) realignment between Forest Way Drive and US 21 Bypass, which is part of a larger project consisting of widening US 21 Bypass and SC 51 from Springfield Parkway to the North Carolina Line. The project is located in Fort Mill, York County, South Carolina, as shown on the Site Plan attached as Sheet 1 in Appendix I.

This RGER applies to the design and construction of the roadway embankments and roadway at grade. The pavement design recommendations are presented under separate cover. S&ME's scope of work relevant to the roadway embankment portion of the project included:

- Visits to the site by geotechnical personnel.
- Coordinating field exploration activities.
- Performing geotechnical subsurface investigations.
- Conducting laboratory testing.
- Reviewing available geologic and geotechnical-related data.
- Conducting geotechnical analyses to assess the encountered subsurface conditions as they relate to their support for the planned roadway embankment regarding slope stability and settlement.
- Preparing this report (RGER) which presents the results of our analyses and our geotechnical recommendations for the planned roadway embankments.

Project design parameters and computations generally follow those described in the relevant sections of the 2019 South Carolina Department of Transportation (SCDOT) Geotechnical Design Manual v2.0 (GDM), except where specifically described otherwise in the report text.

2.0 Project Description

The Gold Hill Road portion of this Pennies for Progress project in York County, South Carolina includes removal of approximately 1,030 feet of the existing roadway between Forest Way Drive to the west and US 21 Bypass to the east. The roadway will be realigned to the north, resulting in approximately 1,845 feet of new roadway. The road will consist of one travel lane in each direction.

2.1 Existing Conditions

The southern approximate 1/3 of the new Gold Hill Road alignment mostly consists of an open grassy field. The northern approximate 2/3 of the alignment mostly consists of woods. Various underground utilities are present at the ends of the roadway, and an overhead power line crosses the southern end of the alignment.

Grades along the centerline of the alignment generally range from elevation 648 to 614 feet, MSL, with two low lying, dry drainage features around Station 24+50 and 27+50.

2.2 Planned Development

From our review of the plan, profile, and cross section sheets, the proposed roadway will generally consist of one 12-foot-wide travel lane in each direction, with two turn lanes added at the northbound/eastbound end at US 21 Bypass. Grades will generally follow existing grades between Station 14+00 to 22+00, and grades will be raised up to 28 feet between Station 22+00 and 28+50. The roadway will require up to 13 feet of cut between Station 28+50 and the tie-in at approximate Station 32+50 (US 21 Bypass). Drain ditches are planned for most of the roadway. Proposed slopes along the project will be 2H:1V or flatter.

3.0 Subsurface Exploration and Laboratory Testing

Representatives of S&ME were present for on-site field activities in March 2022 during the investigation to conduct the following testing:

- Six (6) Standard Penetration Test (SPT) borings (B-12 through B-17).
- Two (2) bulk samples at selected boring locations (B-14 and B-17).
- One (1) undisturbed (Shelby tube) sample at a select boring location (B-15).

The approximate test locations are shown on the Boring Location Plans (Sheet 2) in Appendix I. Boring numbers, station, offset, elevation, and depth are shown in Table 3-1. Termination depths for the SPT borings ranged from 15 feet to 39.4 feet below the existing ground surface. Borings were advanced by an ATV mounted CME 550X-drill rig using hollow-stem auger techniques. The boreholes were left open for at least 1 day to allow for a secondary groundwater level measurement. The borings were backfilled with auger cuttings after the secondary water level measurement attempt. Detailed graphical logs which describe the conditions and results at each test location are presented in Appendix II.

The elevation, station and offset, northing, and easting shown in Table 3-1 and/or on the logs should be considered approximate. This information was obtained from MicroStation files provided by STV. SPT hammer energy measurements were previously performed with a Pile Driving Analyzer (PDA) on the drill rig used to perform the borings. The N-values indicated on the logs are field values and were not corrected for overburden stress, rod length, borehole diameter, or hammer efficiency. Hammer energy ratios are provided on the individual soil test boring records.

Table 3-1: Summary of Test Locations

Test ID	Station	Offset (feet)	Surface Elevation (feet)	Depth (feet)
B-12	17+00	30 LT	630.7	15
B-13	19+00	35 RT	636.8	15
B-14	21+00	30 LT	639.2	20
B-15	24+00	50 LT	609.6	33.8
B-16	27+50	10 LT	629.3	25
B-17	31+00	50 RT	647.2	39.4

S&ME performed the following laboratory tests on recovered split-spoon, undisturbed, and bulk samples to help classify the soils and formulate our conclusions and recommendations.

Table 3-2: Summary of Laboratory Testing Quantities

Test Type	Quantity
Atterberg Limits	10
Grain Size Analysis	10
Natural Moisture Content	10
Standard Proctor	2
California Bearing Ratio	1
Consolidated-Undrained Triaxial Shear	2
Consolidation	1

A summary table of the laboratory test results as well as the individual laboratory test data sheets are included in Appendix III. The laboratory test methods used are indicated on the individual data sheets.

4.0 Subsurface Conditions

4.1 Area Geology

The project lies within the Piedmont Physiographic Province in York County, South Carolina. The Piedmont is bounded to the west by the mountains and east by the Coastal Plain physiographic provinces. The Piedmont region was once a mountain range but through millions of years of erosion its terrain has been reduced to gently rolling hills and relatively flat areas. At the surface the Piedmont the soils are composed of residual soils. These are soils are derived from weathered in place crystalline rock. Through uplift and erosion these soils are continuously weathered and exposed at the surface. The residuum is typically finer grained and has a higher clay content near the surface because of advanced weathering. Similarly, the soils typically become coarse grained with increasing depth because of decreased weathering. Piedmont residuum will often preserve the fabric (texture, appearance, foliations, etc.) of the parent crystalline rock that it is derived from and is called saprolite or described with the adjective, saprolitic. Beneath the residual soils lies a zone of partially weathered rock (PWR) that transitions to parent bedrock. The SPT test is used to determine where the zone of PWR begins and ends and where the bedrock boundary begins. The transition between hard/dense residual soils and PWR occurs at irregular depths due to variations in degree of weathering.

Geologically the project is located within the Charlotte Belt geologic province. The Charlotte Belt is mostly composed of plutonic bodies of rock with compositions ranging from granitic to gabbroic. These rocks were formed in the late Proterozoic to Cambrian periods during the Taconic orogeny when what is believed to be an exotic terrane in the form of a volcanic island arc was sutured to the North American craton. These rocks were later subjected to various degrees of metamorphism, folding and faulting during subsequent crustal reshaping and orogenic episodes. Rock types in this area are predominately composed of metavolcanics such as metagabbro and metadiorite and to a lesser extent biotite gneiss. The figure below shows a generalized geologic

map of the Charlotte Belt in northeastern York County, SC and adjacent Mecklenburg County, NC from 'The Geology of the Carolinas' by Horton and Zullo (1991).

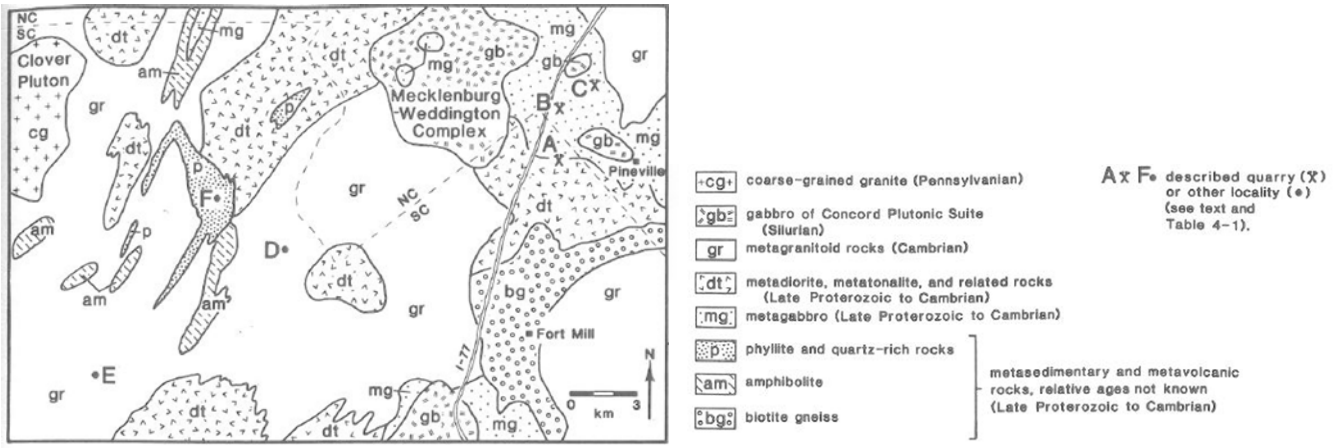

Fig. 4-3 from 'The Geology of the Carolinas' by Horton & Zullo (1991)

Water is typically present in the residual soils and within fractures in the PWR or underlying bedrock in the Piedmont. On upland ridges in the Piedmont, water may or may not be present in the residual soils above the PWR and bedrock. Alluvial soils, which have been transported and deposited by water, are typically found in floodplains and are generally saturated to within a few feet of the ground surface. Fluctuations in water levels are typical in residual soils and PWR in the Piedmont, depending on variations in precipitation, evaporation, and surface water runoff. Seasonal high-water levels are expected to occur during or just after the typically wetter months of the year (November through April).

4.2 Soil and Rock Stratification

The soils encountered by the borings generally consisted of surficial topsoil, residual soils, and Partially Weathered Rock (PWR). The thickness of and depth to the subsurface layers varied in the borings along the alignment. The boring logs should be referenced for details of subsurface conditions at specific locations.

4.2.1 Surface Materials

Surface materials penetrated by the borings consisted of topsoil. Topsoil thicknesses encountered by the borings were approximately 2 to 6 inches.

4.2.2 Residual Soils

Residual soils were encountered in each of the borings to depths of 15 to 37 feet. The residual soils encountered consisted of clay (CH / A-7-5), clayey silt (MH / A-7-5 and A-5), sandy clay (CL / A-6), sandy silt (ML / A-4), and silty sand (SM / A-2-4 and A-4). SPT N-values in the residual soils ranged from 5 to 34 blows per foot. Borings B-12, B-13, B-14, and B-16 were terminated in residual soils at their target depths.

4.2.3 Partially Weathered Rock (PWR)

PWR was first encountered at a depth of 17 feet (approximate elevation 592.6 feet) in Boring B-15 and at a depth of 37 feet (approximate elevation of 610.2 feet) in Boring B-17. The PWR consisted of silty sand (SM / A-2-4) when sampled. Boring B-15 was terminated in PWR at a depth of 33.8 feet and Boring B-17 was terminated in PWR at a depth of 39.4 feet.

4.2.4 Ground Water

Ground water was encountered in Boring B-15 at depths of 14.7 and 16 feet (approximate elevations of 594.9 and 593.6 feet) at drilling termination and after a 1-day waiting period, respectively. Ground water was not encountered in the other five borings at completion of drilling activities of after a 1-day waiting period.

5.0 Seismic Considerations

As described in the GDM, evaluation of performance under the EEI or EEII limit states is not required for roadway embankments. In addition, there are no proposed bridges or earth retaining structures (ERS) within the project limits. Therefore, evaluation of performance under the EEI or EEII limit states is not required for this project.

6.0 Roadway Embankments

The following paragraphs include recommendations for site preparation, fill placement and compaction, and design and construction of embankments. If the construction scope is altered, the proposed embankment locations are changed, or if conditions are encountered during construction that differ from those encountered by the soil test borings, S&ME should be retained to review these recommendations based upon the new information and make any necessary changes.

6.1 Slope Stability Analyses

Based on Section 17.1 of the GDM, embankments with heights of 10 feet or less and slopes 2H:1V, or embankments with heights of 15 feet or less and slopes 3H:1V or flatter do not require analysis. Most of the proposed embankment heights for this project are 10 feet or less. However, from approximately Station 23+50 to 25+50, new embankment is planned with grades raised up to approximately 28 feet with side slopes as steep as 2H:1V. Also, from approximately Station 30+50 to 31+50, the embankment will be cut resulting in up to 13-foot-tall slopes as steep as 2H:1V. Slope stability analyses were conducted on representative cross sections for these two areas. Analyses were performed in general accordance with Chapter 17 of the GDM.

Slope stability analyses were performed using the computer program SLIDE2 Version 9.020 and Spencer circular shear surfaces to find the critical shear surface. Slope stability analysis outputs for the roadway embankments are attached in Appendix IV.

6.1.1 Service Limit State

Soil test boring and laboratory testing results were incorporated into the soil parameters assumed for our service limit state analyses. Soil parameters assumed in global stability computations are included on the analysis outputs in Appendix IV. Our service limit state analyses considered the short-term (end-of-construction) condition as well as the long-term condition as defined in the GDM.

In selecting soil parameters for the proposed embankment fill, we considered the results of the triaxial shear strength testing from planned cut areas, as well as properties presented in the SCDOT *Borrow Materials Database Spreadsheet*, Version 2.0, dated December 6, 2018 for York County, assuming typical Upstate residual type soils and peak effective shear strengths. Based on the available material properties, we selected more conservative values as presented in Table 7-1. It was assumed that pore pressures induced by fill placement would have time to dissipate in the new fill soils. From our analyses, we provide the following results:

Table 6-1: Stability Analysis

Approximate Station	Slope (H:V)	Type	Approximate Height (feet)	Loading Condition	Resistance Factor	
					Computed	Required
24+00 LT	2:1	Fill Slope	28	Short-term	0.71	≤ 0.90
				Long-term	0.71	≤ 0.75
31+00 RT	2:1	Cut Slope	13	Short-term	0.45	≤ 0.90
				Long-term	0.45	≤ 0.75

From the above-summarized results, the computed resistance factors do not exceed the maximum resistance factor for roadway embankment in Table 9-5 of the GDM.

6.2 Settlement Analysis

Relatively little fill placement (10± feet or less) is expected over a majority of the new Gold Hill Road alignment. In these minor fill areas, elastic compression and most consolidation settlements are expected to occur during embankment construction. As a result, post-construction settlement of the embankments is anticipated to be minor and within GDM performance limits. The exception is the new embankment fill proposed from approximately Station 23+50 to 25+50.

Settlement analysis of the fill proposed from approximately Station 23+50 to 25+50 was performed using the computer program Settle3 version 5.013. Plans are to raise grades up to approximately 28 feet in this area. Soil test boring and laboratory testing results were incorporated into the soil parameters for our analysis.

Results of the analysis indicate maximum total settlement is computed to be on the order of 2.7 inches or less in the foundation soils due to placement of the new fill. Settlement within the new fill under its own weight is estimated to be approximately 3 inches. Therefore, maximum total settlement of the new fill is anticipated to be 6 inches or less. Most of the settlement is anticipated to occur progressively as the fill is being constructed. Based on the results of the analysis, post-construction settlements are anticipated to be on the order of 0.5 inches and

are anticipated to occur within approximately 1 month after the end of fill placement. Results of the settlement analyses are presented on the Settle3 output figures provided in Appendix V.

Settlement resulting from placement of the fill was compared to performance limits provided in Table 10-12 of the GDM. From our analyses, we provide the following results:

Table 6-2: Settlement versus Performance Limits

Location	EV-01A Settlement During Construction (inches)	EV-01B Total Post-Construction Settlement (inches)	EV-03 Longitudinal Differential Settlement (inches/50-ft)
Criteria	No Limit	3	1
Embankment Sta. 24+50	5.2	< 1	< 1

From the above-summarized results, the computed vertical settlements satisfy the performance limits outlined in Table 10-12 of the GDM.

Computations show that there need be no requirement for surcharging or wait periods following fill placement to meet the objectives of the GDM. This assumes construction of the fill in accordance with SCDOT standard specifications for earthwork. Geotechnical instrumentation such as settlement plates will not be required.

7.0 Earthwork Considerations

We assume the roadway embankments and cut slopes will be constructed in general conformance with the SCDOT Standard Specifications for Highway Construction, 2007 edition, Division 200. Soils excavated during planned grading activities are Unclassified Excavation unless considered muck or rock excavation as described in Section 203.

7.1 Excavations

PWR was first encountered at a depth of 17 feet (approximate elevation 592.6 feet) in Boring B-15 and at a depth of 37 feet (approximate elevation of 610.2 feet) in Boring B-17. The PWR, when sampled, consisted of silty sand (SM / A-2-4). Boring B-15 was terminated in PWR at a depth of 33.8 feet and Boring B-17 was terminated in PWR at a depth of 39.4 feet.

As previously mentioned, PWR was first encountered at a depth of 17 feet (approximate elevation 592.6 feet) in Boring B-15 and at a depth of 37 feet (approximate elevation of 610.2 feet) in Boring B-17. Auger refusal was not encountered in any of the six borings. Based on the borings and the planned grading, excavation into PWR and/or rock is not anticipated to be required.

The depth to, and thickness of, PWR, rock lenses or seams and bedrock, can vary dramatically in short distances and between boring locations; therefore, PWR, boulders or bedrock may be encountered during any excavation on this project.

7.2 Fill Soil Considerations

Borrow materials shall meet the requirements of subsection 203.2.1.8 of the Standard Specifications for York County. Based on the results of the triaxial shear strength testing from planned cut areas, the cut area soils appear to meet or exceed the shear strength properties used in our analyses.

The fill soil material properties used in slope stability analyses are provided in the following table:

Table 7-1: Fill Material Properties Table

Soil Property	Value Used in Analysis
Effective Friction Angle, φ′	30°
Effective Cohesion, c′	50
Total Unit Weight, γ	120 pcf

7.3 Surface Preparation of Embankments

Embankments planned along existing embankment fills widened to accommodate the planned roadway alignment sections will require preparation as described by the SCDOT standard specifications:

1. Clearing and Grubbing - Before starting embankment construction, clear and grub the embankment area according to Section 201 and install Drainage Structures according to the standard specifications.
2. Depressions and Undercut Areas - Fill depressions below the ground surface and undercut areas with suitable material. Remove unsuitable or unstable material and compact new fill according to Subsection 205.4.6 before beginning embankment construction.
3. Scarification and Other Preparation - Plow and scarify the entire area upon which the embankment is to be placed (except inundated areas) at least 6 in deep.
4. Benching and Compaction of the Subgrade - Before placing the embankment, re-compact loosened soil to the approximate density of the underlying soil. Cut benches as specified in Subsection 205.4.4.
5. Compaction Under Shallow Fills - When the depth of fill and surfacing is 3 feet (1 m) or less, compact the original subgrade at least 1 foot deep to at least 95 percent of the maximum laboratory dry density as determined from representative samples of the compacted material. The in-place density of the compacted fill will be determined according to nuclear gage at random intervals.
6. Embankment Construction - Construct embankments in general accordance with specifications for materials, equipment, measurement, and payment provided in Section 205.

7.4 Shoulders and Slopes

Materials placed at the surface of shoulders and slopes may consist of materials removed from stockpiled soils stripped from within the right-of-way or from areas of roadway and drainage excavation. This may include friable materials capable of growing grass that resist erosion when compacted.

Due to the planned grading, existing subsurface utilities present along the existing alignment at tie-in points may be encountered. Existing utility lines located within right-of way and proposed excavation depths should be removed or plugged and relocated.

7.5 Erosion

The slopes of the new embankments and cut locations will be susceptible to erosion during rainfall events. Construction operations should be performed in a manner consistent with good erosion control practices that minimize soil erosion as described in Subsections 205.4.1, 205.4.1.2, and 205.4.7 of SCDOT Standard Specifications for Highway Construction, 2007 edition. We recommend diverting surface water runoff of slopes by use of berms along the crest and temporary drainage piping. We recommend the slopes be seeded and grassed as soon as practical to minimize the effects of erosion.

7.6 Crossline Reinforced Concrete Pipes

One new crossline stormwater pipe is indicated on the plans. Installation of permanent pipe culverts is typically carried out in accordance with the plans and SCDOT supplemental technical specification SC-M-714 (01/21). Table 7-2 below provides a summary of planned crossline pipes and provides details of pipe location, size, and length as indicated by the cross sections. Table 7-2 also highlights pipe locations that either could require undercut and replacement of bearing soils, or where subsurface water or very dense soils were found near the pipe invert and may require ground water control or special excavation to install.

Table 7-2: Summary of Crossline Pipes

Pipe Details	Station	Approx. Length	Comments
24" SWP (CLP-11)	24+20	155 feet	Boring B-15 suggests stiff to very stiff clayey residual soils near pipe invert elevations

The planned crossline pipes will be installed in areas of the roadway embankment that require up to 28 feet of fill to reach planned grade. Most of the settlement of this new fill and existing subsurface soils are expected to occur during construction of the new embankment with less than 1 inch of settlement to occur post-construction. The contractor shall consider an appropriate construction sequence for the installation of this cross-lined pipe to minimize the impact of settlement of the new pipe.

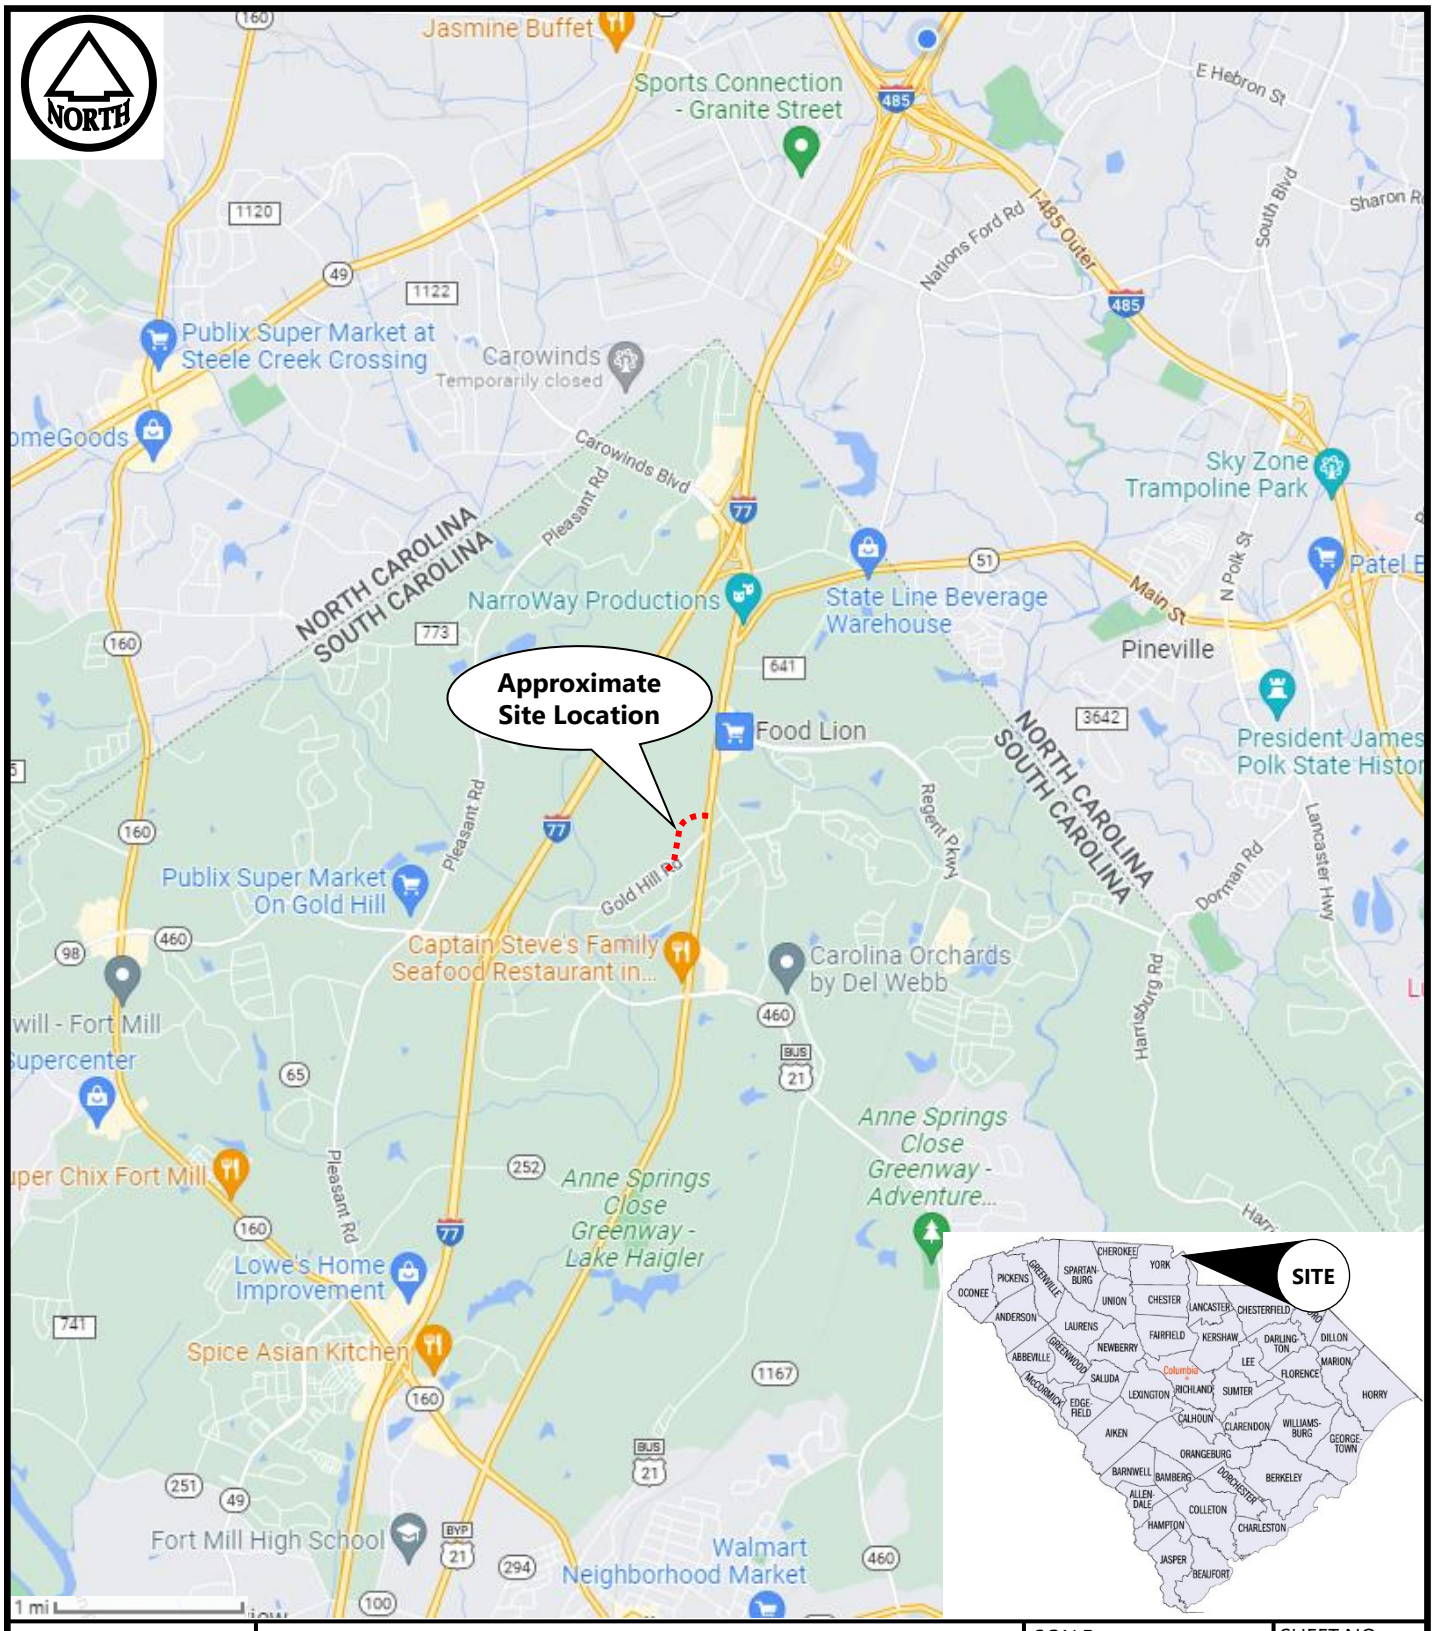
8.0 Recommended Plan Notes

Refer to the previously submitted *Final RGER for the Widening of US 21 Bypass and SC 51 From Springfield Parkway to the NC Line* Report dated September 10, 2021 for recommended plan notes. No new plan notes are associated with the new Gold Hill Road alignment.

9.0 Closing

This report has been prepared in accordance with generally accepted geotechnical engineering practice for specific application to this project. The conclusions and recommendations contained in this report are based upon applicable standards of our practice in this geographic area at the time this report was prepared. No other warranty, express or implied, is made.

We relied on project information given to us to develop our conclusions and recommendations. If project information described in this report is not accurate, or if it changes during project development, we should be notified of the changes so that we can modify our recommendations based on this additional information if necessary.



Our conclusions and recommendations are based on limited data from a field exploration program. Subsurface conditions can vary widely between explored areas. Some variations may not become evident until construction. If conditions are encountered which appear different than those described in our report, we should be notified. This report should not be construed to represent subsurface conditions for the entire site.

Unless specifically noted otherwise, our field exploration program did not include an assessment of regulatory compliance, environmental conditions or pollutants or presence of any biological materials (mold, fungi, bacteria). If there is a concern about these items, other studies should be performed. S&ME can provide a proposal and perform these services if requested.

S&ME should be retained to review the final plans and specifications to confirm that earthwork, foundation, and other recommendations are properly interpreted and implemented. The recommendations in this report are contingent on S&ME's review of final plans and specifications followed by our observation and monitoring of earthwork and foundation construction activities.

Total Pore Pr., psi		72.1	77.0	83.8
Strain, %		1.4	2.2	4.3
Ult. Stress, psi		14.8	14.0	21.2
Total Pore Pr., psi		69.4	74.9	82.0
Strain, %		14.2	15.0	14.4
$\bar{\sigma}_1$ Failure, psi		12.5	12.9	23.2
$\bar{\sigma}_3$ Failure, psi		2.9	3.0	6.2

Type of Test:
CU with Pore Pressures

Sample Type: Remolded

Description: Brown Elastic Silt w/Medium to Fine Sand (MH) A-7-5(25)

LL= 61 **PL=** 35 **PI=** 26

Assumed Specific Gravity= 2.65

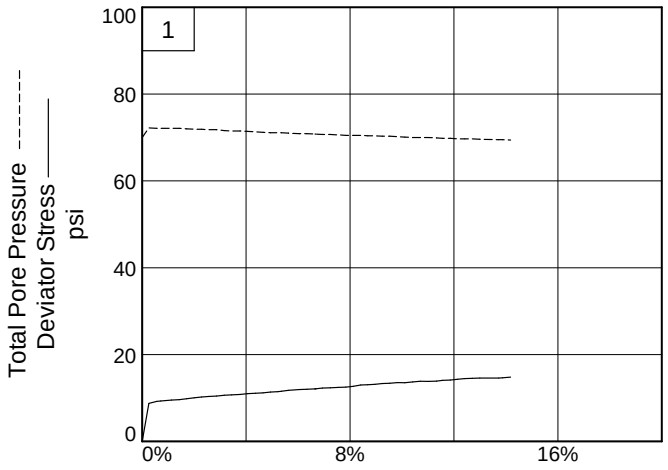
Remarks: Remolded to 95% MDD at -1 to +2% over optimum moisture content (AASHTO T-99). All specimens failed in bulge (AASHTO T-296).

B-14

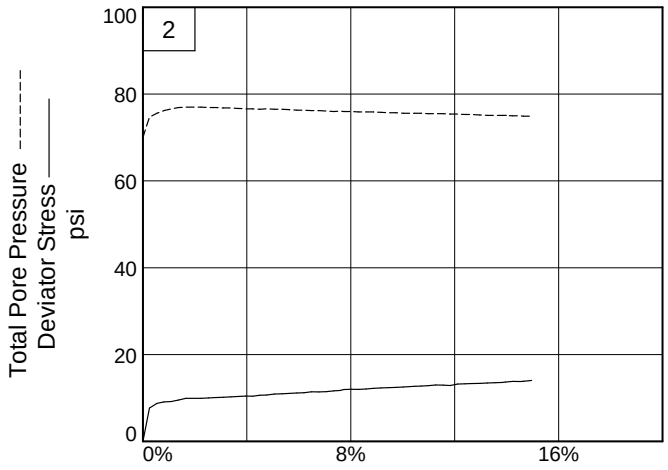
Client: STV Inc.

Project: SCDOT US 21 to SC 51

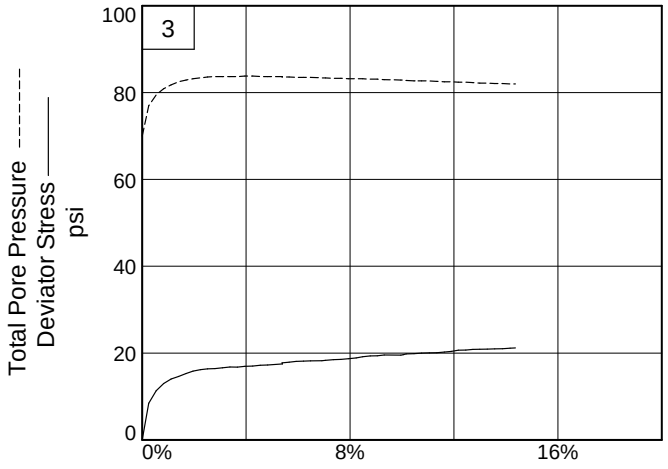
Location: Borings



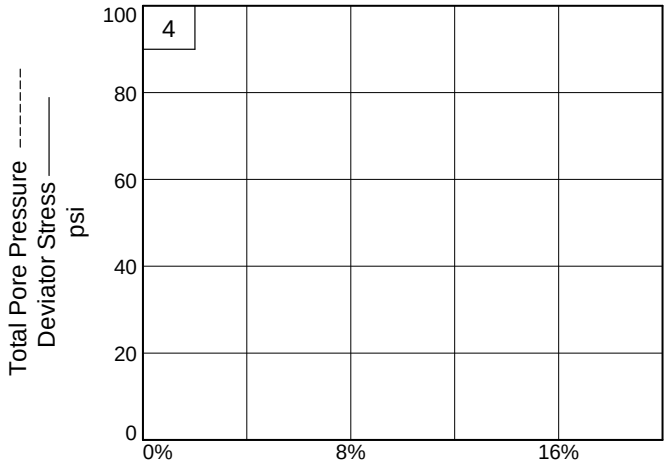
Sample Number: B-14 **Depth:** 0.5-6'



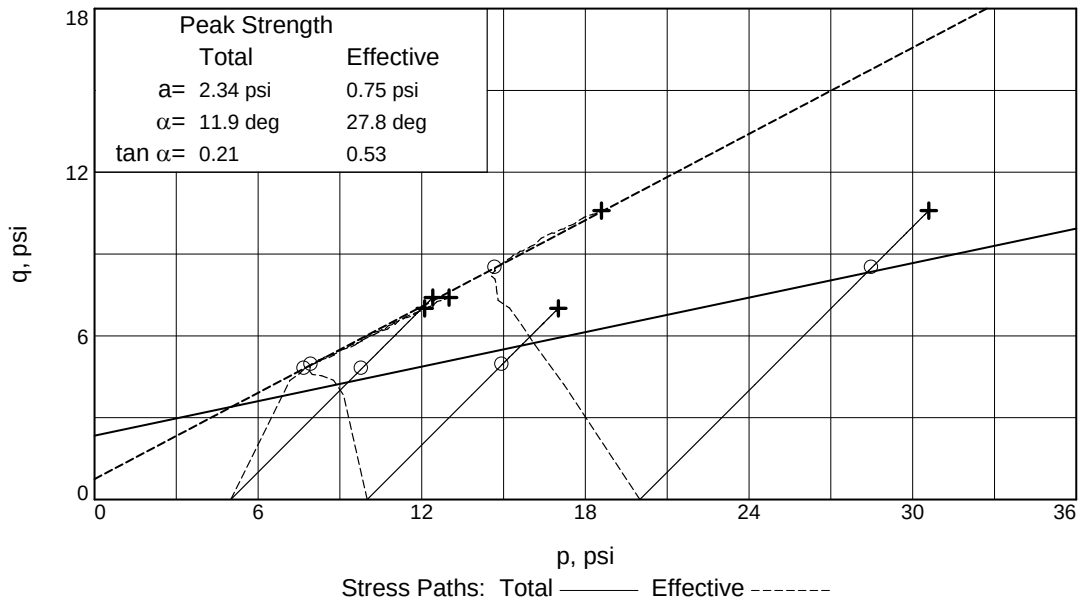
Proj. No.: 1351-12-037 **Date Sampled:** 3/4/22



TRIAXIAL SHEAR TEST REPORT
S & ME, INC.
Charlotte, North Carolina



Tested By: Karen Warner **Checked By:** Kristen Hill, P.E. 4/13/22



C & phi are not test results but an interpretation of the test results. The designer is responsible for interpreting test data as provided by S&ME.

Client: STV Inc.

TRIAXIAL COMPRESSION TEST

CU with Pore Pressures

4/13/2022
11:52 AM

Date: 3/4/22
Client: STV Inc.
Project: SCDOT US 21 to SC 51
Project No.: 1351-12-037
Location: Borings
Depth: 0.5-6' **Sample Number:** B-14
Description: Brown Elastic Silt w/Medium to Fine Sand (MH) A-7-5(25)
Remarks: Remolded to 95% MDD at -1 to +2% over optimum moisture content (AASHTO T-99). All specimens failed in bulge (AASHTO T-296).
Type of Sample: Remolded
Assumed Specific Gravity=2.65 **LL=**61 **PL=**35 **PI=**26
Test Method: COE uniform strain

Parameters for Specimen No. 1

Specimen Parameter	Initial	Saturated	Consolidated	Final
Moisture content: Moist soil+tare, gms.	315.650			n/a
Moisture content: Dry soil+tare, gms.	276.930			n/a
Moisture content: Tare, gms.	126.180			n/a
Moisture, %	25.7	29.1	29.0	
Moist specimen weight, gms.	1143.08			
Diameter, in.	2.877	2.830	2.828	
Area, in.²	6.502	6.291	6.283	
Height, in.	5.997	5.900	5.896	
Net decrease in height, in.		0.097	0.004	
Wet density, pcf	111.7	120.5	120.7	
Dry density, pcf	88.9	93.3	93.5	
Void ratio	0.8618	0.7724	0.7688	
Saturation, %	79.0	100.0	100.0	

Test Readings for Specimen No. 1

Consolidation cell pressure = 75.00 psi
Consolidation back pressure = 70.00 psi
Consolidation effective confining stress = 5.00 psi
Strain rate, in./min. = 0.009
Fail. Stress = 9.60 psi **at reading no.** 5
Ult. Stress = 14.81 psi **at reading no.** 49

Type of Test:
CU with Pore Pressures

Sample Type: Remolded

Description: Red Medium to Fine Sandy Elastic Silt (MH) A-7-5(12)

LL= 53 **PL=** 31 **PI=** 22

Assumed Specific Gravity= 2.65

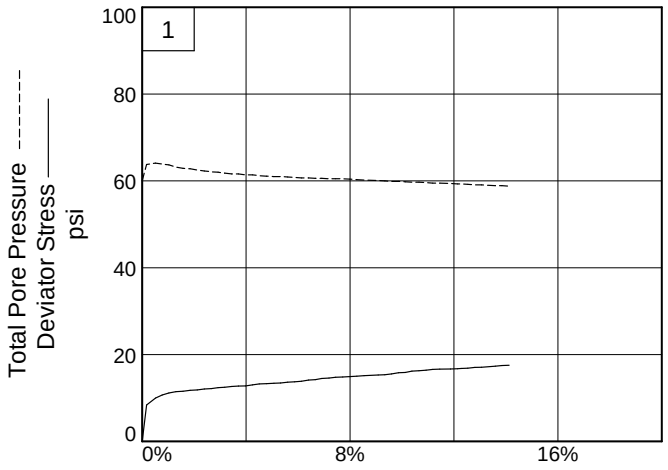
Remarks: Remolded to approximately 95% MDD at -1 to +2% over optimum moisture content (AASHTO T-99). Specimens S-1 and S-2 failed in shear, S-3 failed in bulge (AASHTO T-296).

B-17

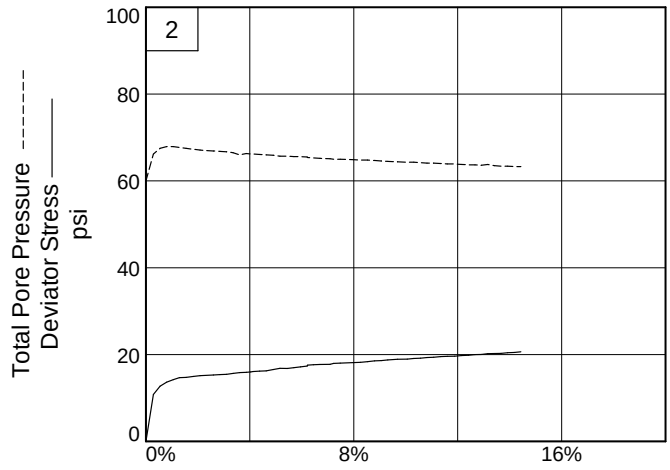
Client: STV Inc.

Project: SCDOT US 21 to SC 51

Location: Borings



Sample Number: B-17 **Depth:** 0.5-10'



Proj. No.: 1351-12-037 **Date Sampled:** 3/25/22

CONSOLIDATION TEST DATA

4/6/2022

Client: STV Inc.
Project: SCDOT US 21 to SC 51
Project Number: 1351-12-037
Location: Borings
Depth: 2.0-4.0 **Sample Number:** B-15 ST-1
Material Description: Brown Red Medium to Fine Sandy Lean Clay (CL) A-6(8)
Liquid Limit: 37 **Plasticity Index:** 16
USCS: CL **AASHTO:** A-6(8)
Figure No.: B-15 ST-1
Testing Remarks: AASHTO T-216 Method B-Inundated
Tested by: Karen Warner **Checked by:** Jason Reeves, P.E.

Test Specimen Data

NATURAL MOISTURE
Wet w+t = 339.78 g.
Dry w+t = 301.46 g.
Tare Wt. = 104.43 g.
Moisture = 19.4 %

VOID RATIO
Spec. Gr. = 2.65
Est. Ht. Solids = 0.634 in.
Init. V.R. = 0.640
Init. Sat. = 80.6 %

AFTER TEST
Wet w+t = 269.93 g.
Dry w+t = 241.14 g.
Tare Wt. = 106.23 g.
Moisture = 21.3 %

UNIT WEIGHT
Height = 1.040 in.
Diameter = 2.498 in.
Weight = 161.31 g.
Dry Dens. = 101.0 pcf

TEST START
Height = 1.040 in.
Diameter = 2.498 in.

Dry Wt. = 134.91* g.

* **Final dry weight used as mineral solids weight**

RE: Limited Phase I Environmental Site Assessment
US Highway 21/SC Highway 51 Road Widening Project
Fort Mill, South Carolina

Dear Ms. Williamson:

We are pleased to submit the enclosed report of the Phase I Environmental Site Assessment (Phase I ESA) for the above-referenced site. The assessment was conducted in conformance with Standard Practice E1527-05 for Environmental Site Assessments published by the ASTM International.

ASTM E1527-05 requires that certain elements of a Phase I ESA be updated if the data for the report is more than six months old. Therefore, if this report is to be relied on after September 2013, we recommend that you contact us to discuss options for an update.

We have identified **nine (9) recognized environmental conditions** (RECs) associated with the site. The findings, opinion and conclusions of this Phase I Environmental Site Assessment are discussed in *Section 9* and *Section 10* of this report.

In accordance with the requirements of the ASTM E1527-05 Standard, we declare that to the best of our professional knowledge and belief, we meet the definition of an environmental professional as defined in §312.10 of 40 CFR 312 and we have the specific qualifications based on education, training, and experience to assess the nature, history, and setting of the site. We have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Thank you for the opportunity to conduct this work. Please contact us at 803-376-6034 if we can be of further assistance.

Sincerely,

Reginald Butler

1 Introduction

Fuss & O'Neill, Inc. (Fuss & O'Neill) conducted a Limited Phase I Environmental Site Assessment (Phase I ESA) at the request of Ms. Sheri Williamson of STV/Ralph Whitehead Associates, as due diligence for the acquisition of the right-of-way (ROW) property by the Pennies for Progress Program for road widening along US Highway 21/SC Highway 51 in Fort Mill, York County, South Carolina.

The section for improvement along US Highway 21/SC Highway 51 will extend approximately 2.5 miles from Springfield Parkway to the North Carolina State line (*Figure 1*). The existing highway is a two lane road with grass shoulders and drainage ditches. This project corridor will be known as the *property* throughout this report.

This assessment was conducted as a preliminary assessment that was restricted to non-invasive types of investigations. The conclusions reached and the representations contained herein, are based on the available data and on the contracted scope of work. Fuss & O'Neill makes no representations or conclusions or information beyond the scope of this assessment.

1.1 Objective

The objective of this Phase I ESA is to identify recognized environmental conditions (RECs) present at the *property*. As defined by Standard Practice for Environmental Site Assessments E1527 05 developed by the ASTM International (ASTM, 2005), REC means:

> *…the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term includes hazardous substances or petroleum products even under conditions in compliance with laws. The term is not intended to include de minimis conditions that generally do not present a material risk of harm to public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.*

1.2 Scope of Services

Our Limited Phase I ESA was performed in general conformance with Standard Practice E1527-05 for Environmental Site Assessments by the ASTM International (ASTM, 2005). Since this Phase I ESA is was conducted for a corridor, some information for each individually owned parcel along the *property* was not reasonably ascertainable within the time and cost constraints of this investigation due to the large number of land parcels associated with individual property owners. Current and past uses of specific properties were identified through the review of the regulatory database search, site reconnaissance, and/or other publicly available sources of information. This information is discussed in detail in *Section 4* of this report.

This Limited Phase I ESA deviates from ASTM E1527-05 in the following ways:

- Past or current uses of the properties, adjoining properties, and/or the surrounding area were not identified through interviews with the past or present individual parcel owners and/or past or present occupants.
- Past uses prior to 1970 were not identified through the review of historic aerial photographs.
- Interior observations of the structures along the *property* were not identified.
- Recorded land title records, liens, and/or zoning/land use records on individual properties along the *property* were not assessed. This includes environmental liens or activity and use limitations (AULs).
- The *User* of the report, York County and its agents, was not given a "User Questionnaire" because it is unrealistic for a government entity to have specialized knowledge on small parcels of land along an extensive corridor. Therefore, the review of title and judicial records for environmental liens, AULs, or ascertainable recorded land title records were not supplied by the *User* of this report.

Assessments for asbestos-containing materials (ACM), lead-based paint or plumbing materials, radon gas, and mold were not conducted. Furthermore, we did not investigate the potential for the *property* to contain endangered species, ecological resources or historic/cultural resources. Additionally, environmental compliance or permitting issues were not considered during this investigation.

It is our understanding that this work is not being conducted under a United States Environmental Protection Agency (USEPA) Brownfield Assessment and Characterization Program grant awarded under Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) 9604(k)(2)(b); therefore, our investigation did not include an assessment of controlled substances. Refer to *Section 15* of this report for limitations on this work product.

2 *Property* Overview and Environmental Setting

2.1 *Property* Location

The US Highway 21/SC Highway 51 road widening project is located north of downtown Fort Mill between Springfield Parkway and the North Carolina/South Carolina state line (Figure 1). The project corridor has a linear roadway distance of approximately 13,200 feet. The proposed limits of construction for this project will require acquisition of additional right-of-way (ROW).

The *property* is located in an area of mixed residential, industrial, and commercial parcels. A site location map showing the approximate project corridor is provided as *Figure 1* and a site topographic map of the *property* is included as *Figure 2*.

2.2 Utilities

The City of Fort Mill and York County provides municipal water and sewer service in the area to the *property*. Electrical power is provided to the *property* by Duke Energy. Electric, cable, and telephone services to the *property* are provided via underground conduits and overhead transmission lines.

2.3 Adjoining Land Use

As with any Phase I ESA, nearby land usage is always a concern and investigating adjoining land uses that could potentially impact the surface and subsurface conditions of the *property* is a vital part of performing a complete Phase I ESA.

From observations made during the site reconnaissance and through review of historic and current aerial images, the *property* is located in an area of mixed residential, industrial, and commercial parcels. Specific uses of adjoining parcels are addressed in *Sections 4* and *Section 6*. A search of all public records for each individual parcel along the *property* was not reasonably ascertainable within the time and cost constraints of this project as outlined in *Section 1.2* of this report.

2.4 Environmental Setting

2.4.1 Geology

According to the Geologic Notes*, Volume 9, Number 2* (State Development Board, June 2010), York County is situated in the north-central Piedmont of South Carolina, adjacent to the North Carolina state line. Rocks of the Piedmont occur in belts that conform to the regional-northeasterly trend of major structural features. The belts are delineated by gross differences in rock types, grade of metamorphism, and structure. York County straddles the Charlotte Belt and extends into the Caro1ina Slate Belt to the east and into the Kings Mountain Belt to the northwest.

Rocks of the Carolina Slate Belt are mainly low rank metamorphic rocks of sedimentary and volcanic origin. The Charlotte Belt includes medium- to high-rank metamorphic rocks and a complicated sequence of igneous intrusions. Major rock types of the Kings Mountain Belt are phyllite, schist, gneiss, quartzite, conglomerate, and marble. The metamorphic grade of the Kings Mountain Belt ranges from medium to low.

2.4.2 Topography

According to the topographic maps reviewed for this assessment, the *property* and surrounding area ranges from approximately 590 feet to 650 feet above mean sea level (MSL). Topography of the *property* site generally slopes south to southeast towards tributaries of the Blackmanship Branch, Steele Creek, and the Sugar Creek. These creeks discharge into the Catawba River.

2.4.3 Hydrology & Hydrogeology

The soils encountered in this area are the residual product of in-place chemical weathering of rock presently underlying the site. In general, shallow unconfined groundwater movement within the overlying soils is controlled largely by topographic gradients. However, as the groundwater percolates downward to the bedrock, it becomes controlled by the orientation of the rock fracture systems. Thus the direction of groundwater movement may not be consistent with the reflection topography.

Recharge occurs primarily by infiltration along higher elevations and typically discharges into streams or other surface water bodies. The elevation of the shallow water table is transient and can vary with seasonal fluctuations in precipitation. Movement of groundwater under water table conditions is generally from higher to lower elevations. As such, shallow groundwater at the subject site appears to move to the north and northeast towards lower elevations and off-site water bodies.

Based on USGS mapping and field observations of the local topography regarding the physical setting, the groundwater flow direction of the *property* appears to vary throughout the corridor. The inferred dominant groundwater flow direction along the project corridor appears to be to the south/southeast toward tributaries of Sugar Creek and Sugar Creek. Groundwater along the project corridor is believed to vary from 5 feet to 60 feet below ground surface based on elevations of nearby water bodies.

The *property* is located west of Sugar Creek which discharges to the Catawba River. Surface runoff from the site would appear to flow to the south/southeast toward tributaries of Sugar Creek and Sugar Creek with components of flow to the southwest towards Blankmanship Branch which discharges to Steele Creek than eventually discharges to Sugar Creek.

2.4.4 Soils

According to the USDA Natural Resources Conservation Service Soil Survey, the soils along the corridor are classified as Cecil sandy clay loam (CeB2), Mecklenburg-Wynott complex (MeB2),and Pacolet clay loam (PcE3). Cecil sandy clay loam and Pacolet clay loam soils are well-drained members of Hydrologic Soil Group B. These soils have moderately high to high transmissivity in the most limiting layers of the soil unit along the project corridor. Mecklenburg-Wynott is not a well-drained soil and belongs to Hydrologic Soil Group C. A copy of the soil report is located in *Appendix C*.

2.4.5 Wetlands & Flood Zone Mapping

Based on the U.S. Fish and Wildlife Service's National Wetlands Inventory (NWI, 2012) and observations made during the site walkover, there are no mapped wetlands located on the *property*. The Federal Emergency Management Agency's (FEMA) Flood Insurance Rate Map Database (FEMA, 2010) shows no mapped floodplains within the *property*. A copy of the FEMA map is included in *Appendix D*. As a wetlands survey is beyond the scope of this Phase I ESA, it is recommended that a wetlands survey be performed for the *property* if it is needed.

2.5 Previous Environmental Investigations

The following environmental investigations of adjacent properties of the *property* were identified and reviewed during the performance of this assessment.

1) Underground Storage Tank closure Report by Steffen, Robertson and Kirsten, Inc. (SRK) for Municipal Engineering for Container Corporation of Carolina, report dated September 26, 1996. SRK concluded that the chance of future environmental impact on the groundwater from USTs at this site is very low. Container Corporation of Carolina is located at 3358 Highway 51.

2) Soil Sampling Analysis Report by Environmental Management Solutions, Inc. (EMS) dated February 26, 1997 for Partex, Inc. / Eumeric Holdings. SCDHEC concluded that the areas of concern had been adequately addressed with regard to the spill area on the exterior of this facility. Partex, Inc. / Eumeric Holdings is located at 3551 Highway 51.

3) Post Remediation Sampling Report conducted by Consultech Environmental, Inc. for Lords Armory dated August 18, 2003. Consultech Environmental, Inc. concluded that concentrations of the contaminants of concern in all of the monitoring wells that have site-specific target levels (SSTLs) are below SSTLs at the site, recommended that all of the monitoring wells be properly abandoned, and that no further action be taken at the site. Lords Armory is located at 3660 Highway 51.

3 Site History

The following sources were used to develop the history of the *property*.

- Aerial imagery of the project corridor dating back to 1970 was viewed utilizing York County's GIS interactive mapping. Aerial imagery was reviewed by Mr. Reginald Butler of Fuss & O'Neill.

4 Federal, State, and Local File Review

Fuss & O'Neill reviewed database information compiled by Environmental Data Resources Inc., (EDR) to help identify RECs in connection with the project corridor. EDR is an environmental database search service that provides access to publicly available environmental databases maintained by various federal, state, and local agencies. The sources of information listed in the following table were researched to identify properties of concern within a specified search radius from the *property* as specified by ASTM Practice E1527-05. These records are identified by the ASTM International as "standard environmental record sources" requiring review. The listed information sources are defined and described in detail in the EDR database report and included in *Appendix A*.

The results of the review are shown in the table below. Databases with listings identified on the *property* or within the minimum search are discussed in a brief narrative following the table.

4.1 Federal Regulatory Agency Review

Database	ASTM Minimum Search Distance	Listings w/in 1,000 Foot Buffer
NPL	1.0 Mile	No
Delisted NPL	0.5 Mile	No
CERCLIS	0.5 Mile	No
CERCLIS-NFRAP	0.5 Mile	No
RCRA - CORRACTS	1.0 Mile	No
RCRA -TSD	0.5 Mile	No
RCRA - GEN	0.25 Mile	1
IC/EC Registry	*Property*	No
ERNS	*Property*	No

Potential environmental conditions were identified along the project corridor during review of "Standard Environmental Record Sources" of Federal Regulatory Agencies. 33 non-geocoded were included within the "Orphan Summary" supplied by EDR. Non-geocoded sites, or orphan sites, are facilities that could not be precisely located due to inadequate address information. The EDR report provides further details of the orphan sites identified in the databases. Fuss & O'Neill personnel make every effort within reasonable time and cost to locate non-geocoded listings that could influence the *property*.

- **(RCRA GEN) –** The RCRA GEN database includes information on sites that generate, store, treat, or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act. Facilities are considered large quantity generators (LQGs) if they generate more than 1,000 kg of hazardous waste per month or more than1 kg of acutely hazardous waste per month. Facilities are considered SQGs if they generate between 100 kg and 1,000 kg of hazardous waste per month or less than 1 kg of acutely hazardous waste, or meet other applicable requirements of RCRA. Facilities producing less than 100kg of hazardous waste per month are classified as CESQGs. A review of the most recent database indicated that there is **one (1)** reported RCRA GEN site within the search radius for the project corridor.

    1. Container Corporation of Carolina (CCC) (EPA I.D No.1000395755) located at 3358 Highway 51, Fort Mill, SC, is listed as a municipal solid waste (MSW) facility. This site is the one RCRA GEN site listed through our database search.

4.2 State Regulatory Review

Database	ASTM Minimum Search Distance	Listings w/in 1,000 Foot Buffer
STATE CERCLIS	1.0 Mile	No
SWL	0.5 Mile	**1**
LUST	0.5 Mile	**4**
UST/AST	0.5 Mile	**5**
IC/EC Registry	1.0 Mile	No
VCC	0.5 Mile	No
BROWNFIELDS	0.25 Mile	No

- **State Solid Waste Landfill (SWL/LF) -** The SWL/LF database is a listing of those facilities, involved with the handling of solid waste and includes locations of solid waste landfilling or associated activities involving the handling of solid waste. A review of the most recent database indicated **one (1)** reported SWL/LF property within the project corridor search radius.

    1. Container Corporation of Carolina (CCC) (EPA I.D No.1000395755) located at 3358 Highway 51, Fort Mill, South Carolina, is listed as a municipal solid waste (MSW) facility. MSW facilities accept combined residential, commercial/institutional waste generated. Though classified as a MSW facility in the database search report, CCC is better classified as a Class 3 MSW Transfer Station. Transfer stations are facilities where municipal solid waste is unloaded from collection vehicles and briefly held while it is reloaded onto larger long-distance transport vehicles for shipment to landfills or other treatment or disposal facilities. The database search shows the facility as a handler of tetrachloroethylene a chlorinated compound that has been the contaminant of concern at many soil and groundwater contaminated sites throughout the state.

- **Leaking Underground Storage Tank (LUST) -** The South Carolina LUST summary database contains information pertaining to all reported leaking storage tank cases. A review of the EDR report and the SCDHEC database indicates that there are **four (4)** LUST listings within the project corridor search radius.

    1. Summerville Grocery (SCDHEC Site I.D 14057) located at the parcel adjacent to 3660 Highway 51, Fort Mill, SC, is listed as a LUST site within SCDHECs database system. The site was granted a no further action (NFA) from SCDHEC on May 9, 1997.

    2. Lords Armory (SCDHEC Site I.D 14058) located at 3660 Highway 51, Fort Mill, SC, is listed as a LUST site within SCDHECs database system. The site was granted a conditional no further action (CNFA) from SCDHEC on May 9, 1997. The site was granted the CNFA status because groundwater is not currently being used, is reasonably anticipated not to be used in the future within the actual or predicted area of petroleum impact, petroleum chemicals of concern (CoCs) associated with the release are below site specific target levels (SSTL), groundwater will not be used for drinking or irrigation within the area of petroleum impact, and land use of the site will not change without notifying SCDHEC.

    3. Pantry 3969 doing business as (DBA) Petro Express (SCDHEC Site I.D 10515) located at 3473 Highway 21, Fort Mill, SC, is listed as a LUST site within SCDHECs database system. The site was granted a NFA from SCDHEC on January 6, 1999.

    4. Handy Pantry 28 Food Mart (SCDHEC Site I.D 09316) located at 3004 Highway 21 Bypass, Fort Mill, SC, is listed as a LUST site within SCDHECs database system. The site has not been granted a NFA from SCDHEC and is undergoing active corrective action (remediation).

    The LUST sites found by the database search and included within the "orphan summary" are not considered to be RECs due to their physical or geographical location in reference to the *property*.

Potential historical RECs (HRECs) or RECs were identified for the *property* through review of Standard Environmental Record Sources of Federal Agencies. These RECs will be addressed in *Section 9*.

- **Underground Storage Tank (UST)/Aboveground Storage Tank (AST) Report -** The UST/AST report includes a listing of properties with USTs and ASTs that are registered with the SCDHEC. A review of the most recent listings reports there are **five (5)** sites within the project corridor search radius.

    1. Millers Produce & Farm Inc. (SCDHEC Site ID 12165) located at 3660 Highway 51, Fort Mill, SC, is listed as a UST site within SCDHECs database system. The site currently has five regulated USTs in use. A diesel fuel UST was previously used on this site but it has been properly abandoned.

    2. Summerville Grocery (SCDHEC Site ID 14057) located at the parcel adjacent to 3660 Highway 51, Fort Mill, SC is listed as a UST site within SCDHECs database system. The site formerly housed two regulated USTs but these tanks have been properly abandoned.

    3. Lords Armory (SCDHEC Site ID 14058) located at 3660 Highway 51, Fort Mill, SC, is listed as a UST site within SCDHECs database system. The site formerly housed two regulated USTs but these tanks have been properly abandoned.

    4. Pantry 3969 DBA Petro Express (SCDHEC Site ID 10515) located at 3473 Highway 21, Fort Mill, SC, is listed as a UST site within SCDHECs database system. The site currently houses four regulated USTs that are still in use.

    5. Handy Pantry 28 Food Mart (SCDHEC Site ID 09316) located at 3004 Highway 21 Bypass, Fort Mill, SC, is listed as a UST site within SCDHECs database system. The site formerly housed three regulated USTs but these tanks have been properly abandoned.

    6. The UST sites found by the database search and included within the "orphan summary" are not considered to be RECs due to their physical or geographical/topographical location in reference to the project corridor.

The EDR report in *Appendix A* provides further details of the "orphan sites" identified in the databases.

4.3 Additional Environmental Records Sources

Fuss & O'Neill reviewed additional environmental record sources as part of its due diligence in completing this Phase I ESA.

4.3.1 South Carolina Groundwater Contaminant Inventory

Fuss & O'Neill reviewed the South Carolina Groundwater Contaminant Inventory (GWCI) for sites along the project corridor and sites located within the project corridor search radius that may be of

interest. The GWCI is a listing of known groundwater contaminant plumes throughout the state of South Carolina as maintained by the SCDHEC.

At the time of the compilation of this inventory in 2008 by SCDHEC, there were 171 sites in York County with known present or past groundwater contamination. Through review of the GWCI in combination with Fuss & O'Neill personnel identifying common groundwater contamination characteristics (including monitoring well and/or soil borings) along the project corridor, two additional sites were identified in the *property* that are UST/LUST sites. The following additional sites along the project corridor were discovered during the review of the GWCI:

Times Turn Around 10 – This site is located at 2488 US 21 Bypass, Fort Mill SC. The site currently operates as a gasoline retailer, and is listed in the GWCI, and has a monitoring well network associated with the site.

T & G's Country Store – This site is located at 2976 Highway 21, Fort Mill SC. The site currently appears to not be in operation, is listed in the GWCI, and has a monitoring well network associated with the site.

A copy of the York County GWCI is included in *Appendix E*.

4.3.2 Freedom of Information Act File Review

Fuss & O'Neill requested a Freedom of Information Act (FOIA) file review on January 29, 2013 for properties located at 3660 Highway 51, 3578 Highway 51, 3550 Highway 51, 3551 Highway 51, 3490 Highway 51, 3410 Highway 51, 3358 Highway 51, and the intersection of Highway US 21 & SC 51. Of the ten parcels listed, information was available for four of the properties.

The SCDHEC files on the selected properties along the *property* were reviewed by Fuss & O'Neill personnel on April 8-9, 2013. Environmental investigations at the Lord's Armory (3578 Highway 51), Container Corporation of Carolina (3358 Highway 51), Miller Produce and Farm (3660 Highway 51), Partex/Eumeric Holdings (3551 Highway 51), and at Paving Equipment of the Carolinas (3550 Highway 51) were reviewed and utilized during this Phase I ESA. The following was found during this FOIA file review:

- Container Corporation of Carolina – A UST closure report dated February 27, 1997 for the Carolina Corporation of Carolina by Steffen Robertson and Kirsten (SRK), was reviewed by Fuss & O'Neill personnel. The findings of the report documented four areas of concern (AOCs) at the site where closure activities took place. The four AOCs consisted of three UST storage areas and one concrete pad. Cumulatively thirteen USTs, two oil water separators, and one concrete pad along with underlying soils were removed during closure activities. Post removal soil samples were taken at all four locations. Benzene, toluene, ethylbenzene, xylenes, and naphthalene were present in post removal sampling.

- The Lord's Armory – SCDHECs response letter dated October 6. 2003 and a closure letter report by Consultech Environmental for the Lord's Armory dated September 23, 2003 was found and reviewed during our search of additional environmental record sources. The closure letter report

stated that all wells associated with Lord's Armory were below applicable detection limits or below SSTLs during closure sampling events. A CNFA was granted at the site for a release that had previously occurred at the referenced site. The CNFA was granted with specific conditions in place for the site. These conditions are:

1) Groundwater is not currently being used and is reasonably anticipated not to be used in the future within the actual or predicted area of petroleum impact.
2) All petroleum CoCs associated with the referenced UST release are below the SSTLs in soil and groundwater. Based on these site specific conditions, the CoCs will not exceed RBSLs at any potential receptors and/or exposure points.
3) The groundwater should not be used as a source of drinking water of for irrigation within the area of petroleum impact.
4) Land use should not change without notifying the Bureau of the proposed use. Any site excavation activities may encounter petroleum impacted soil that must be disposed of in a method approved by the department.
5) If CoCs from the referenced release are detected at levels that present a risk to human health or the environment, this office, under authority established in the South Carolina UST Control Regulations (SCUSTCR) R.61-92 Part 280, may require additional site rehabilitation.
6) The Bureau will be notified within 30 days of any changes to any of the above assumptions and conditions until all petroleum constituents are at or below RBSL. If site conditions are changed without Department approval, the owner or operator will be in violation of a Department order enforceable pursuant to the 1976 Code Section 44-2-140.

- Partex, Inc. / Eumeric Holdings – Fuss & O'Neill personnel reviewed a SCDHEC memorandum regarding administrative order 97-11-HW. The administrative order was issued to Mr. Anthony R. Jans for violations of the South Carolina Hazardous Waste Management Regulations and the South Carolina Pollution Control Act. The findings of fact of this order stated that Partex did not have an EPA identification number, Partex had not made hazardous waste determinations for numerous wastes stored on-site, and a spill from an on-site air scrubber had impacted an area of soil approximately 144 square feet. Soil taken from the spill area detected the presence of Chromium. Additional information about the extent of this contamination was not in the SCDHEC files reviewed by Fuss & O'Neill personnel.

- Paving Equipment of the Carolinas – An air emissions report for the referenced facility was reviewed by Fuss & O'Neill personnel. The facility operated as an asphalt plant and stored #2 fuel oil on-site. These were the only files found for this site.

4.3.3 City Directories Summary

EDR provided city directories for years ranging from 1997 to 2013. Fuss & O'Neill reviewed address listings as applicable to individual sites in compiling properties of interest. No additional properties of interests were found during the review of city directories. City directories are provided in *Appendix A*.

5 User-Provided Information

ASTM Practice E1527-05 describes certain tasks to be performed by the *user* of this assessment that will help to identify RECs at the parcel if they exist. ASTM Practice E1527-05 defines the *user* as "the party seeking to use Practice E1527 to complete an environmental site assessment of the *property*". *User*s can include a potential purchaser or tenant of the *property*, a lender, a *property* manager, or a *property* owner. The users of this report will be York County and its agents.

As documented in *Section 1.2* of this report, the *User* of this report was not asked to complete the All Appropriate Inquiry Phase I User Questionnaire (AAI Questionnaire) during this scope of work. Due to the fact that this Limited Phase I ESA corridor study is linear in nature and not an individual property, a property record and liens review was not conducted during this scope of work.

6 Site Reconnaissance

A site reconnaissance of the *property* was conducted on January 21, 2013 by Mr. Reginald Butler of Fuss & O'Neill. The objective of the site reconnaissance for a Phase I ESA is to assess if there is evidence of hazardous substances or petroleum products that were disposed of or used on the site at any time in the past that may create potential liability for an owner of the *property*. This evidence can be circumstantial such as the observation of stressed vegetation, staining, unlabeled or suspicious containers or structures, unidentified oily substances, pooled liquids, odors and the like. If identified, these observations can be listed as RECs which may require additional investigation.

The site reconnaissance entailed driving the *property*, verifying the existence of sites that were identified by the environmental database search, searching for sites that may not have been identified on the database search, and by the visual observation of indicators of potential environmental concerns as outlined above. Photographs taken during the site reconnaissance are in *Appendix B*.

6.1 Site Access and Limitations

As this is a Limited Phase I ESA only public entry areas were accessible during this assessment.

The inaccessibility of structures within the proposed right of way expansion may be considered a data gap. However, it is believed that the thorough review of database searches, review of available aerial photography, and visual observations made during the site reconnaissance, sufficient information was gathered to assess those areas that Fuss & O'Neill personnel could not directly access.

6.1.1 Hazardous Substances in and not in Connection with Identified Uses

Several properties along the *property* are suspected of using and storing various chemical substances. Some of the suspected substances included degreasers, dry cleaner cleaning fluids, and unknowns. A full inventory of the types of chemicals and storage locations is beyond the scope of this investigation.

6.1.2 Petroleum Products in and not in Connection with Identified Uses

Several properties along the *property* are suspected of using and storing various petroleum products. Some of the petroleum products included gasoline, diesel fuel, used oil, fuel oil, and unknowns. A full inventory of the types of petroleum products and storage locations is beyond the scope of this investigation but properties that use or store these chemicals have been identified.

6.1.3 Storage Tanks

The EDR environmental database records indicated and Fuss & O'Neill reconnaissance confirmed the locations of underground storage tanks at the following locations:

- Millers Produce & Farm Inc., 3660 Highway 51
- Pantry 3969 DBA Petro Express, 3473 Highway 21
- Handy Pantry 28 Food Mart, 3004 US 21 Bypass
- Summerville Grocery, Highway 51

The following locations with USTs were found during the site reconnaissance but were not listed in the database search.

- Times Turn Around 10, 2448 US Highway 21
- T & G's Country Store, 2976 US Highway 21

Above ground storage tanks were not located during the corridor reconnaissance or on the database records search within the project corridor except at the following site.

- Container Corporation of the Carolinas – 2 ASTs

6.1.4 Polychlorinated Biphenyls (PCBs)

Electrical transformers manufactured prior to 1979 generally contained PCB-oils. PCBs are polychlorinated biphenyl's and have been determined to be a likely carcinogen. The production of PCB fluids were discontinued in the United States in 1977 and new PCB-oil containing equipment was banned on July 1, 1979. Pole-mounted and pad mounted transformers were observed during site reconnaissance. However, there was no indication that these transformers were leaking or had leaked in the past.

A power transmission station with numerous transformers was observed at 2014 Highway 21. The distance of the transmission station from the current road and proposed road widening area should limit the potential for PCB impact to the subsurface near the ROW.

6.1.5 Solid Waste Disposal

Container Corporation of Carolina (EPA I.D No.1000395755) located at 3358 Highway 51, Fort Mill, South Carolina was listed as a MSW facility within the database search and the facility was located and verified during the site reconnaissance.

6.1.6 Stormwater

Storm water runoff from the roadway along the project corridor flows by sheet drainage into roadside drainage swales, from the drainage swales, storm water flows into nearby surface water bodies.

6.1.7 Stained or Environmentally Stressed Areas

No major staining or stressed vegetation areas were observed along the project corridor during the site reconnaissance.

6.1.8 Wells

Several monitoring wells associated with petroleum releases were observed during the site reconnaissance at Millers Produce and Farm Inc., Southern Tree & Landscaping, T&G Country Store, and Time Turn Around 10.

6.1.9 Potable Water / Wastewater

Municipal water and sewer service is maintained and supplied to the majority of the project corridor by York County's public works department. There are still several private water supply wells on parcels throughout the corridor and suspected septic systems as well. A possible septic tank was seen at 2448 US Highway 21 during the site reconnaissance.

There was previously an oil water separator (OWS) at the Container Corporation of Carolina located at 3358 Highway 51, Fort Mill SC to handle wastewater from the facility according to the closure report for Carolina Corp of Carolina (*Section 4.3*). Though there is no knowledge of the discharge location of the OWS located at the referenced site, there is a high probability that this facility once did not have access to municipal water and sewer and could have utilized a leach field as a discharge point for effluent discharge from the OWS.

6.1.10 Additional Environmental Concerns

During the site reconnaissance evidence of a monitoring well network was found at the site of the former Southern Tree & Landscape Co. No information was found during FOI file review and Southern Tree & Landscape Co. was only mentioned as a small quantity generator during our database search.

6.2 Non-ASTM Scope Considerations

Unless otherwise specified, the following items were not considered in the course of completing this ASTM E1527-05 Phase I ESA:

- Asbestos, Lead (paint/plumbing), Radon, Mold, Fluorescent Light Ballasts
- Ecological Resources, Historical/Cultural Resources
- Regulatory and Health & Safety Compliance
- Endangered species

7 Interviews

7.1 Interview with Local Government Official

Fuss & O'Neill personnel contacted the Fort Mill Department (name of person spoken to, phone number) to obtain information regarding the *property*. Fuss & O'Neill personnel were informed that information could not be released without submitting an FOIA request. The fire department said these request normally take 6-8 weeks to process. The 6-8 week FOIA request and file review for sites listed in *Section 10* were not reasonably ascertainable within the time and cost constraints of this investigation.

8 Data Gaps and Deviations

8.1 Data Gaps & Failures

Standard Practice E 1527-05 requires the identification and evaluation of data gaps or data failures, which are defined as a lack of or inability to obtain information required by the practice despite good faith efforts by the environmental professional to gather such information.

Items that would normally be considered data gaps are addressed in *Section 8.2.*.

The city directories and aerial photographs did not go back to 1940 or the time of first use. This would be considered a data failure.

8.2 Deviations

The report was conducted in general accordance with ASTM E1527-05 guidance for conducting Phase I ESAs. Since this Phase I ESA is being developed for a corridor, specific information for each individually owned parcel along the *property* was not reasonably ascertainable within the time and cost constraints of this investigation.

This Limited Phase I ESA deviates from ASTM E1527-05 in the following ways:

- Past or current uses of the properties, adjoining properties, and/or the surrounding area were not identified through interviews with the past or present individual parcel owners and/or past or present occupants.
- Past uses prior to 1970 were not identified through the review of historic aerial photographs.
- Interior observations of the structures along the *property* were not identified.
- Recorded land title records, liens, and/or zoning/land use records on individual properties along the *property* were not assessed. This includes environmental liens or activity and use limitations (AULs).
- The *User* of the report, York County and its agents was not given a "User Questionnaire" because it is unrealistic for a government entity to have specialized knowledge on small parcels of land along an extensive corridor. Therefore, the review of title and judicial records for environmental liens, AULs, or ascertainable recorded land title records were not supplied by the *User* of this report.

9 Findings

Findings of this Phase I ESA identify known or suspect RECs and HRECs. ASTM E 1527-05 states that an HREC is "an environmental condition in the past would have been considered a *recognized environmental condition*, but which may or may not be considered a *recognized environmental condition* currently. If a past release of any hazardous substances or petroleum products has occurred in connection with the *property* and has been remediated, with such remediation accepted by the responsible regulatory agency (for example, as evidenced by the issuance of a no further action letter or equivalent), this condition shall be considered an historical recognized environmental condition" The following suspect RECs and HRECs were observed during the Phase I ESA.

RECs

Container Corporation of Carolina: This site is located approximately 700 feet to the south of Highway 51 in a down to side-gradient location in proximity to the *property*.. The site is known to have had subsurface petroleum contamination in the past.

Handy Pantry 28 Food Mart: This site is located within the project corridor on the eastern side of Highway 21, is a known LUST site with limited information available, and no longer operates as a fuel retailer

Lords Armory: This site is located within the project corridor on the southern side of Highway 51 and is a known LUST site that has undergone active remediation Underground Injection Control (UIC). Direct push injection of Regenesis Corporation's oxygen release compound (ORC) was the remediation technology used to remediate the groundwater contaminant plume at the site.

Millers Produce & Farm Inc.: This site is located within the project corridor on the eastern side of Highway 21, is a known UST site with limited information available. An FOIA request was submitted to obtain any documented information regarding the site. A letter from SCDHEC dated September 8, 2002stating that SCDHEC requires no further site assessment or

rehabilitation of the site was the only documentation obtained from the FOI request. The site currently operates as a fuel retailer.

Partex/Eumeric Holdings: This site is located within the project corridor on the northern side of Highway 51, is known to have had Chromium contaminated soilin the past, and has had violations of the South Carolina Hazardous Waste Management Regulations and the South Carolina Pollution Control Act. The violations at the site were for failure to comply with the following regulations:

1. R.61-79.262.11, a person who generates a solid waste, as defined in R.61-79.261.2 must accurately determine if that waste is a hazardous waste;
2. R.61-79.262.12(a), a generator must not treat, store, dispose of, or offer for transportation, hazardous waste without having received an EPA identification number from SCDHEC;
3. R.61-79.262, Subpart C, Pre-transport requirements for generators of hazardous waste
4. R.61-79.262, Subpart D, record keeping and reporting requirements for generators of hazardous waste;
5. R.61-79.262.80, a generator must clean up any hazardous waste discharge that occurs during generation of processing or storage and take such other action as may be required or approved by Federal, State, or local officials so that the hazardous waste discharge no longer presents a hazard to human health of the environment; and,
6. 48-1-90 of the South Carolina Pollution control Act in that it shall be unlawful for any person, directly or indirectly, top throw, drain, run, allow to seep or otherwise discharge into the environment of the state organic or inorganic matter, including sewage, industrial wastes and other wastes, except as in compliance with a permit issued by SCDHEC.

Paving Equipment of the Carolinas: This site is located within the project corridor on the southern side of Highway 51, is known to have stored #2 fuel oil in the past, and formerly operated as an asphalt manufacturing facility.

Pantry 3969 DBA Petro Express: This site (SCDHEC Site I.D 10515) is located at 3473 Highway 21, Fort Mill, SC (approximately 2000 feet north of the intersection of US 21 and SC 51) is listed as a LUST site within SCDHECs database system. The site was granted a no further action (NFA) from SCDHEC on January 6, 1999. A new leak was detected at the site in January 19, 2012. No additional information regarding the leak was able to be obtained during this scope of work.

Southern Tree & Landscaping: This parcel is located within the project corridor at the intersection of Highway 21 and Highway 51. A monitoring well network was observed on the parcel during the site reconnaissance.

Summerville Grocery: This parcel is located within the project corridor on the eastern side of Highway 21. This parcel is a known LUST site with limited information available. The site no longer operates as a fuel retailer

T&G Country Store: This parcel is located within the project corridor on the eastern side of Highway 21. This parcel is a known LUST site with limited information available.

Times Turn Around 10: This parcel is located within the project corridor on the eastern side of Highway 21. This parcel is a known LUST site with limited information available. The site currently operates as a fuel retailer.

Historical RECs

The first release at the Pantry 3969 site may be considered an HREC.

10 Opinions

We have performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-05 for the *property*. Any exceptions to, or deletions from, this practice are described in *Section 8* of this report. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the *property* except for the following:

- **Container Corporation of Carolina:** SCDHEC files reviewed by Fuss & O'Neill personnel did not to eliminate the possibility of contamination from this site moving off-site and potentially affecting adjoining parcels. The Container Corporation of Carolina site is located down to side-gradient of the project corridor and areas of the property with known or suspect hazardous chemical and/or petroleum usage are several hundred feet from the right-of-way. Therefore, previous or unreported releases would not affect the *property* and this site is not considered an REC.

- **Millers Produce & Farm Inc.:** This site is located within the project corridor on the eastern side of Highway 21, and is a known LUST site with limited information available. The site no longer operates as a fuel retailer. Due to the limited attainable information pertaining to this site and a known release of petroleum on the site, this site is considered an REC.

- **Summerville Grocery:** This site is located within the project corridor on the eastern side of Highway 21, is a known LUST site with limited information available, and no longer operates as a petroleum retailer. SCDHEC reported that information pertaining to the Summerville Grocery site has been purged from the SCDHEC file system. Due to the limited attainable information pertaining to this site, this site is considered an REC.

- **Lords Armory:** A former petroleum release at the site was granted a CNFA in 2003. The CNFA was granted with land use restrictions in place and varying amounts of petroleum contamination were allowed to remain in place at the site. Because of petroleum contamination remaining in place at the site and the potential for this contamination to be encountered during construction activities, this site is considered an REC.
- **Pantry 3969 DBA Petro Express**: Although this site was reported within our database search radius and a new leak was found at this site in 2012, due to this site's distance from the project corridor this site is not considered an REC.

- **Partex/Eumeric Holdings:** An administrative order (97-11-HW) was issued on the facility by SCDHEC in 1997 for violations of the South Carolina Hazardous Waste Management

Regulations and the South Carolina Pollution Control Act for failure to comply with regulations. Partex/Eumeric Holdings failed to comply with regulations listed in *Section 9*. Information regarding these violations and compliance or non-compliance of issues addressed in the administrative order were not found during FOI file review and have possibly been purged from SCHECs file system. Due to the lack of information on this facility and known past soil contamination the Environmental Professional conducting this Phase I ESA concludes this property is currently an REC.

- **Paving Equipment of the Carolinas:** This property formerly stored #2 fuel oil and was a manufacturer of petroleum-based asphalt. Because of the storage of #2 fuel oil and past use of the property, this site is considered an REC.

- **Southern Tree & Landscaping:** During the site reconnaissance, a monitoring well network was observed at the intersection of US 21 and SC 51 on a site which formerly operated as Southern Tree & Landscaping. Review of SCDHECs files did not return information pertaining to this site and it is believed that information on this site has been purged from SCDHECs file system. The presence of an on-site monitoring well network and limited attainable information pertaining to this site, this site is considered an REC.

- **Handy Pantry 28 Food Mart:** SCDHEC files did not contain information for the Handy Pantry 28 Food Mart. The facility is a former LUST site and was listed on the 2008 GWCI for York County. With the lack of available SCDHEC files and classification of the site as a LUST site, this site is considered an REC.

- **T&G Country Store:** This site is located within the project corridor on the eastern side of Highway 21 and is a known LUST site with limited information available. Because of the known release of petroleum at this site, the site is considered an REC.

- **Times Turn Around 10:** This site is located within the project corridor on the eastern side of Highway 21, Review of SCDHECs files did not return information pertaining to this site and it is believed that information on this site has been purged from SCDHECs file system. This site is a known LUST site with limited information available, and currently operates as a fuel retailer. Because of the known release of petroleum at this site, the site is considered an REC.

A map displaying the locations of these RECs is included as *Figure 3*.

11 Conclusions

We have performed a *Phase I Environmental Site Assessment* in conformance with the scope and limitations of ASTM Practice E1527 of the properties located along Highway 21/ Highway 51 in Fort Mill, York County, South Carolina, the *property* (project corridor). Any exceptions to, or deletions from, this practice are described in *Section8.2* of this *report*. This assessment has revealed no evidence of *recognized environmental conditions* in connection with the *property* except for the following:

- Millers Produce and Farm Inc.
- Summerville Grocery

- Lords Armory
- Partex/Eumeric Holdings
- Paving Equipment of the Carolinas
- Sothern Tree & Landscaping
- Handy Pantry 28 Food Mart
- T&G Country Store
- Times Turn Around 10

Although there were deviations from the ASTM E1527-05, this Limited Phase I ESA addressed the potential for environmental liabilities from the presence of soil or groundwater contamination and/or the presence of hazardous waste or hazardous materials within the reasonably ascertainable time and cost constraints.

12 Additional Investigation

In accordance with Section 12.6.1 of ASTM Standard Practice E1527-05, additional subsurface investigations are recommended due to RECs being present along the project corridor.

13 Qualifications

This Phase I Environmental Site Assessment was performed by Fuss & O'Neill staff members Mr. Reginald Butler and Mr. Jeremy Grant, P.G. Mr. Grant is a professional geologist in the state of South Carolina that served as the Project Manager for this project and senior reviewer of this report. He has 18 years of experience in the environmental industry and has a Bachelor of Arts degree and a Master of Science degree in Geology. Mr. Grant's resume is included in *Appendix F*.

13.1 Signature(s) of Environmental Professional(s)

I declare that, to the best of my professional knowledge and belief, I meet the definition of *Environmental Professionals* (EP) as defined in Part 312.10 of 40 CFR 312. I have the specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the subject *property*. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Jeremy Grant, P.G.
Project Manager

15 Limitations of Work Product

This document was prepared for the sole use of **York County and its agents,** the only intended beneficiaries of our work. Those who may use or rely upon the report and the services (hereafter "work product") performed by Fuss & O'Neill, Inc. and/or its subsidiaries or independent professional associates, subconsultants and subcontractors (collectively the "Consultant") expressly accept the work product upon the following specific conditions.

1. Consultant represents that it prepared the work product in accordance with the professional and industry standards prevailing at the time such services were rendered.

2. The work product may contain information that is time sensitive. The work product was prepared by Consultant subject to the particular scope limitations, budgetary and time constraints and business objectives of the Client which are detailed therein or in the contract between Consultant and Client. Changes in use, tenants, work practices, storage, Federal, state or local laws, rules or regulations may affect the work product.

3. The observations described and upon which the work product was based were made under the conditions stated therein. Any conclusions presented in the work product were based solely upon the services described therein, and not on scientific or engineering tasks or procedures beyond the scope of described services.

4. In preparing its work product, Consultant may have relied on certain information provided by state and local officials and information and representations made by other parties referenced therein, and on information contained in the files of state and/or local agencies made available at the time of the project. To the extent that such files which may affect the conclusions of the work product are missing, incomplete, inaccurate or not provided, Consultant is not responsible. Although there may have been some degree of overlap in the information provided by these various sources, Consultant did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this project. Consultant assumes no responsibility or liability to discover or determine any defects in such information which could result in failure to identify contamination or other defect in, at or near the site. Unless specifically stated in the work product, Consultant assumes no responsibility or liability for the accuracy of drawings and reports obtained, received or reviewed.

5. If the purpose of this project was to assess the physical characteristics of the subject site with respect to the presence in the environment of hazardous substances, waste or petroleum and chemical products and wastes as defined in the work product, unless otherwise noted, no specific attempt was made to check the compliance of present or past owners or operators of the subject site with Federal, state, or local laws and regulations, environmental or otherwise.

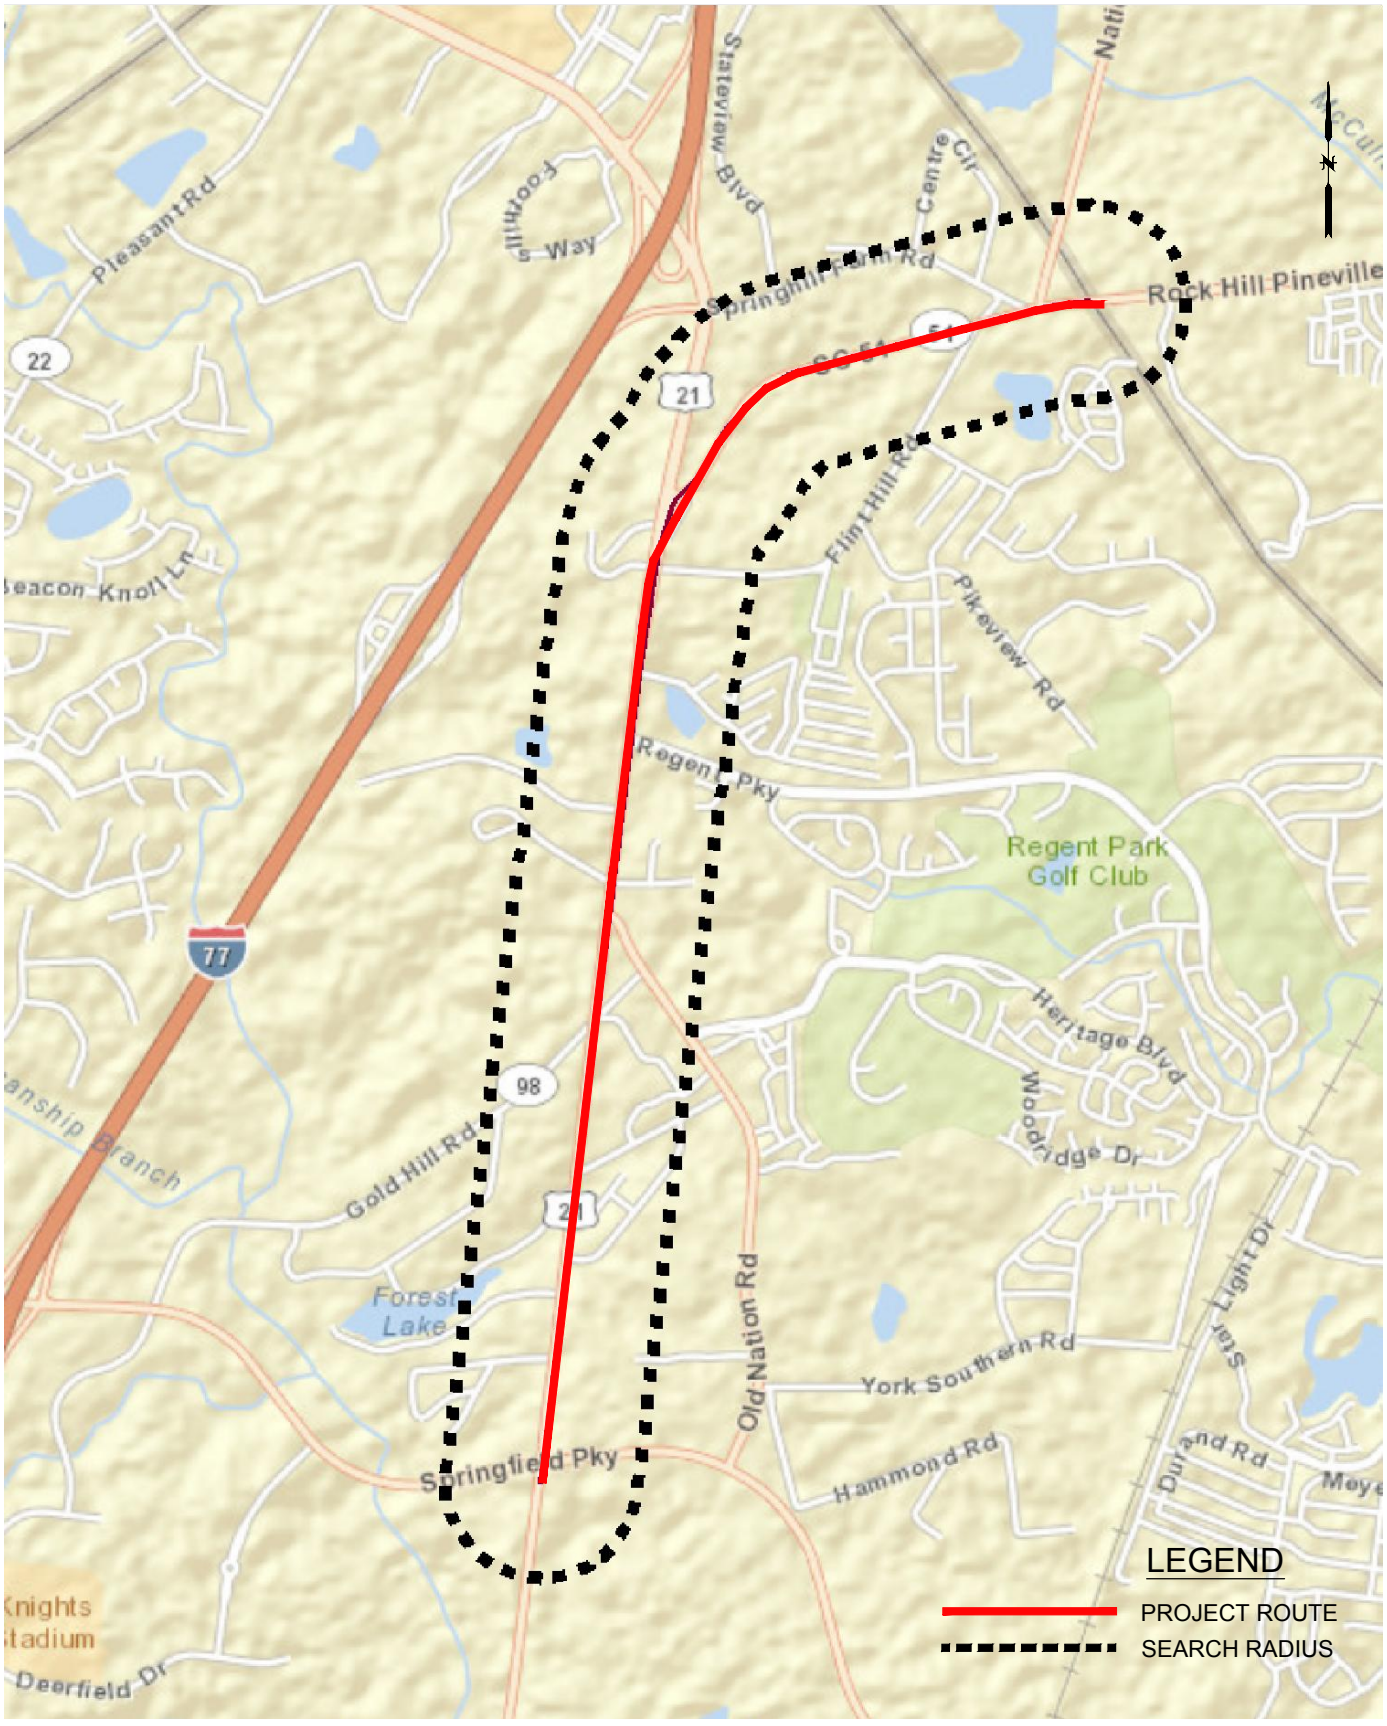
6. If water level readings have been made, these observations were made at the times and under the conditions stated in the report. However, it must be noted that fluctuations in water levels

may occur due to variations in rainfall, passage of time and other factors and such fluctuations may affect the conclusions and recommendations presented herein.

7. Except as noted in the work product, no quantitative laboratory testing was performed as part of the project. Where such analyses have been conducted by an outside laboratory, Consultant has relied upon the data provided, and unless otherwise described in the work product has not conducted an independent evaluation of the reliability of these tests.

8. If the conclusions and recommendations contained in the work product are based, in part, upon various types of chemical data, then the conclusions and recommendations are contingent upon the validity of such data. These data (if obtained) have been reviewed and interpretations made by Consultant. If indicated in the work product, some of these data may be preliminary or screening-level data and should be confirmed with quantitative analyses if more specific information is necessary. Moreover, it should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time and other factors.

9. Chemical analyses may have been performed for specific parameters during the course of this project, as described in the work product. However, it should be noted that additional chemical constituents not included in the analyses conducted for the project may be present in soil, groundwater, surface water, sediments or building materials at the subject site.



10. Ownership and property interests of all documents, including reports, electronic media, drawings and specifications, prepared or furnished by Consultant pursuant to this project are subject to the terms and conditions specified in the contract between the Consultant and Client, whether or not the project is completed.

11. Unless otherwise specifically noted in the work product or a requirement of the contract between the Consultant and Client, any reuse, modification or disbursement of documents to third parties will be at the sole risk of the third party and without liability or legal exposure to Consultant.

12. In the event that any questions arise with respect to the scope or meaning of Consultant's work product, immediately contact Consultant for clarification, explanation or to update the work product. In addition, Consultant has the right to verify, at the party's expense, the accuracy of the information contained in the work product, as deemed necessary by Consultant, based upon the passage of time or other material change in conditions since conducting the work.

13. Any use of or reliance on the work product shall constitute acceptance of the terms hereof.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

FEDERAL RECORDS

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 09/11/2012 has revealed that there is 1 RCRA-CESQG site within the searched area.

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 09/11/2012 has revealed that there are 3 RCRA-NonGen sites within the searched area.

EXECUTIVE SUMMARY

FINDS: The Facility Index System contains both facility information and "pointers" to other sources of information that contain more detail. These include: RCRIS; Permit Compliance System (PCS); Aerometric Information Retrieval System (AIRS); FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]; CERCLIS; DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes); Federal Underground Injection Control (FURS); Federal Reporting Data System (FRDS); Surface Impoundments (SIA); TSCA Chemicals in Commerce Information System (CICS); PADS; RCRA-J (medical waste transporters/disposers); TRIS; and TSCA. The source of this database is the U.S. EPA/NTIS.

A review of the FINDS list, as provided by EDR, and dated 10/23/2011 has revealed that there are 16 FINDS sites within the searched area.

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

Environmental Interest/Information System
SC-EFIS (South Carolina - Environmental Facility Information System)

EUMERIC HOLDINGS NV (Continued) **1001120786**

integrates information on environmental facilities, permits, violations, enforcement actions, and compliance activities needed to support regulatory requirements and target environmental quality improvements for the water, air, solid waste, and hazardous waste program areas. The EFIS was developed by the state of South Carolina and Maine joined their system in 2004.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F004
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: CRESOLS AND CRESYLIC ACID, AND NITROBENZENE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

SC-EFIS (South Carolina - Environmental Facility Information System) integrates information on environmental facilities, permits, violations, enforcement actions, and compliance activities needed to support regulatory requirements and target environmental quality improvements for the water, air, solid waste, and hazardous waste program areas. GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/01/2012

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 10/01/2012
Date Data Arrived at EDR: 10/11/2012
Date Made Active in Reports: 12/20/2012

Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991
Date Data Arrived at EDR: 02/02/1994
Date Made Active in Reports: 03/30/1994

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 11/02/2012

Last EDR Contact: 01/04/2013
Next Scheduled EDR Contact: 03/11/2013
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 09/11/2012

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

FINDS: Facility Index System/Facility Registry System

Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Next Scheduled EDR Contact: 03/25/2013
Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

US HIST CDL: National Clandestine Laboratory Register

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

EPA WATCH LIST: EPA WATCH LIST
EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)
The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

2020 COR ACTION: 2020 Corrective Action Program List
The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

STATE AND LOCAL RECORDS

SC SHWS: Site Assessment Section Project List

State Hazardous Waste Sites. State hazardous waste site records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. Available information varies by state.

SC ALLSITES: Site Assessment & Remediation Public Record Database

The South Carolina Department of Health and Environmental Control is pleased to have the Public Record for your review. The purpose of this database is two-fold. First, it will provide to communities another form of notice of cleanup activity, allowing them to have more information about assessment and cleanup activities in their area and in the State. Second, it can assist those seeking to redevelop brownfield properties within South Carolina.

Next Scheduled EDR Contact: 04/01/2013
Data Release Frequency: Quarterly

SC VCP: Voluntary Cleanup Sites
Sites participating in the Voluntary Cleanup Program. Once staff and a non-responsible party have agreed upon an approved scope of work for a site investigation and/or remediation, the party enters into a voluntary cleanup contract. Staff oversees the cleanup efforts to ensure that activities are performed to our satisfaction. Upon completion of the negotiated work in the voluntary cleanup contract, the non-responsible party receives State Superfund liability protection.

Date of Government Version: 09/19/2012

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR PROPRIETARY RECORDS

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Next Scheduled EDR Contact: 04/01/2013
Data Release Frequency: Annually

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

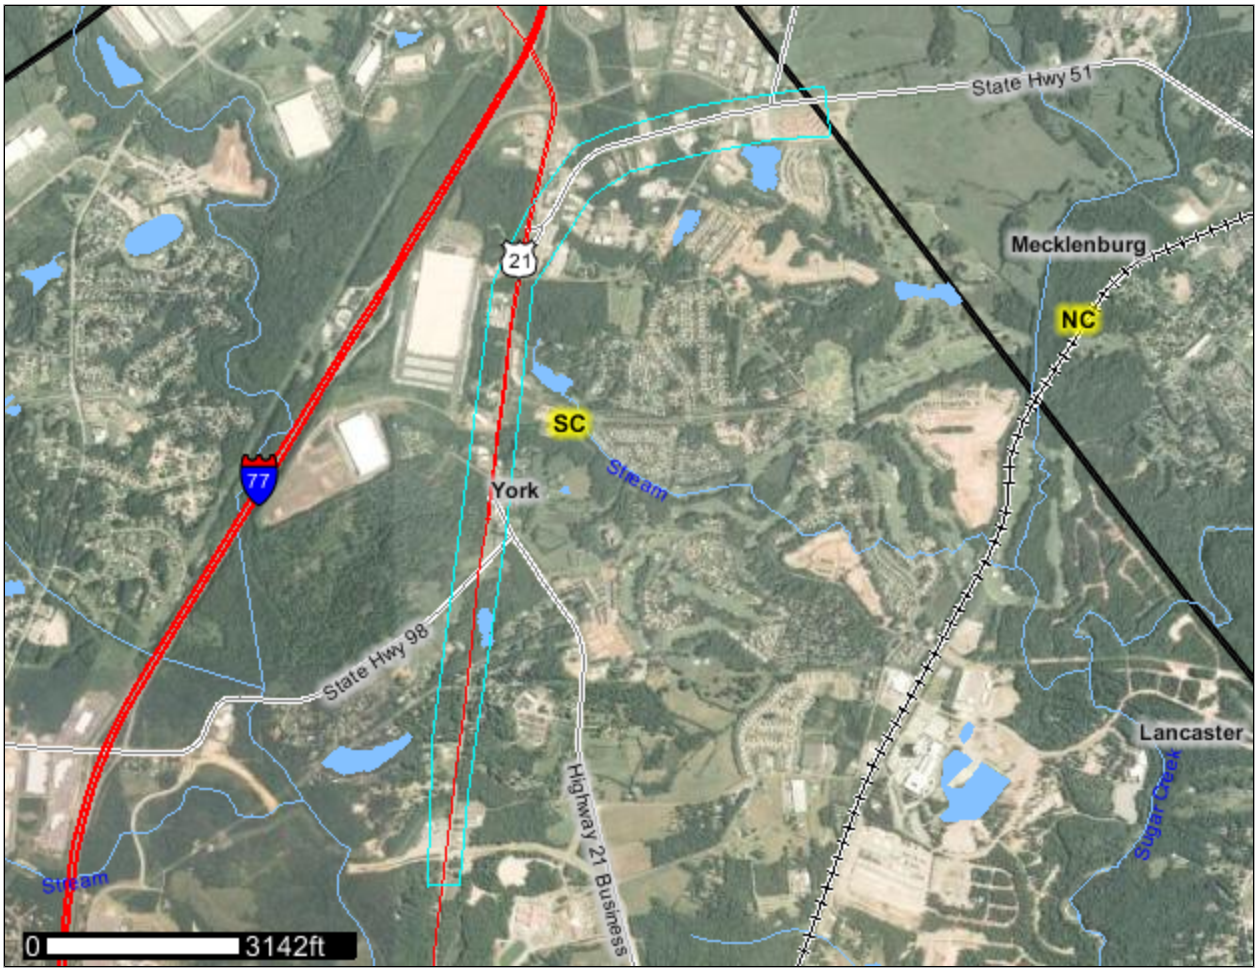
Soil Survey

United States Department of Agriculture



NRCS

Natural Resources Conservation Service

A product of the National Cooperative Soil Survey, a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local participants

Custom Soil Resource Report for Mecklenburg County, North Carolina, and York County, South Carolina

US 21 SC 51

April 29, 2013

Preface

Soil surveys contain information that affects land use planning in survey areas. They highlight soil limitations that affect various land uses and provide information about the properties of the soils in the survey areas. Soil surveys are designed for many different users, including farmers, ranchers, foresters, agronomists, urban planners, community officials, engineers, developers, builders, and home buyers. Also, conservationists, teachers, students, and specialists in recreation, waste disposal, and pollution control can use the surveys to help them understand, protect, or enhance the environment.

Various land use regulations of Federal, State, and local governments may impose special restrictions on land use or land treatment. Soil surveys identify soil properties that are used in making various land use or land treatment decisions. The information is intended to help the land users identify and reduce the effects of soil limitations on various land uses. The landowner or user is responsible for identifying and complying with existing laws and regulations.

Although soil survey information can be used for general farm, local, and wider area planning, onsite investigation is needed to supplement this information in some cases. Examples include soil quality assessments (http://soils.usda.gov/sqi/) and certain conservation and engineering applications. For more detailed information, contact your local USDA Service Center (http://offices.sc.egov.usda.gov/locator/app?agency=nrcs) or your NRCS State Soil Scientist (http://soils.usda.gov/contact/state_offices/).

Great differences in soil properties can occur within short distances. Some soils are seasonally wet or subject to flooding. Some are too unstable to be used as a foundation for buildings or roads. Clayey or wet soils are poorly suited to use as septic tank absorption fields. A high water table makes a soil poorly suited to basements or underground installations.

The National Cooperative Soil Survey is a joint effort of the United States Department of Agriculture and other Federal agencies, State agencies including the Agricultural Experiment Stations, and local agencies. The Natural Resources Conservation Service (NRCS) has leadership for the Federal part of the National Cooperative Soil Survey.

Information about soils is updated periodically. Updated information is available through the NRCS Soil Data Mart Web site or the NRCS Web Soil Survey. The Soil Data Mart is the data storage site for the official soil survey information.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means

for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination, write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer.

Soil Map

The soil map section includes the soil map for the defined area of interest, a list of soil map units on the map and extent of each map unit, and cartographic symbols displayed on the map. Also presented are various metadata about data used to produce the map, and a description of each soil map unit.

MAP INFORMATION

Map Scale: 1:21,200 if printed on A size (8.5" × 11") sheet.

The soil surveys that comprise your AOI were mapped at scales ranging from 1:15,840 to 1:24,000.

Please rely on the bar scale on each map sheet for accurate map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL: http://websoilsurvey.nrcs.usda.gov
Coordinate System: UTM Zone 17N NAD83

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Mecklenburg County, North Carolina
Survey Area Data: Version 12, Jul 6, 2012

Soil Survey Area: York County, South Carolina
Survey Area Data: Version 9, Sep 29, 2011

Your area of interest (AOI) includes more than one soil survey area. These survey areas may have been mapped at different scales, with a different land use in mind, at different times, or at different levels of detail. This may result in map unit symbols, soil properties, and interpretations that do not completely agree across soil survey area boundaries.

Date(s) aerial images were photographed: 7/10/2006; 7/17/2006

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Descriptions

The map units delineated on the detailed soil maps in a soil survey represent the soils or miscellaneous areas in the survey area. The map unit descriptions, along with the maps, can be used to determine the composition and properties of a unit.

A map unit delineation on a soil map represents an area dominated by one or more major kinds of soil or miscellaneous areas. A map unit is identified and named according to the taxonomic classification of the dominant soils. Within a taxonomic class there are precisely defined limits for the properties of the soils. On the landscape, however, the soils are natural phenomena, and they have the characteristic variability of all natural phenomena. Thus, the range of some observed properties may extend beyond the limits defined for a taxonomic class. Areas of soils of a single taxonomic class rarely, if ever, can be mapped without including areas of other taxonomic classes. Consequently, every map unit is made up of the soils or miscellaneous areas for which it is named and some minor components that belong to taxonomic classes other than those of the major soils.

Most minor soils have properties similar to those of the dominant soil or soils in the map unit, and thus they do not affect use and management. These are called noncontrasting, or similar, components. They may or may not be mentioned in a particular map unit description. Other minor components, however, have properties and behavioral characteristics divergent enough to affect use or to require different management. These are called contrasting, or dissimilar, components. They generally are in small areas and could not be mapped separately because of the scale used. Some small areas of strongly contrasting soils or miscellaneous areas are identified by a special symbol on the maps. If included in the database for a given area, the contrasting minor components are identified in the map unit descriptions along with some characteristics of each. A few areas of minor components may not have been observed, and consequently they are not mentioned in the descriptions, especially where the pattern was so complex that it was impractical to make enough observations to identify all the soils and miscellaneous areas on the landscape.

The presence of minor components in a map unit in no way diminishes the usefulness or accuracy of the data. The objective of mapping is not to delineate pure taxonomic classes but rather to separate the landscape into landforms or landform segments that have similar use and management requirements. The delineation of such segments on the map provides sufficient information for the development of resource plans. If intensive use of small areas is planned, however, onsite investigation is needed to define and locate the soils and miscellaneous areas.

An identifying symbol precedes the map unit name in the map unit descriptions. Each description includes general facts about the unit and gives important soil properties and qualities.

Soils that have profiles that are almost alike make up a *soil series*. Except for differences in texture of the surface layer, all the soils of a series have major horizons that are similar in composition, thickness, and arrangement.

Soils of one series can differ in texture of the surface layer, slope, stoniness, salinity, degree of erosion, and other characteristics that affect their use. On the basis of such differences, a soil series is divided into *soil phases*. Most of the areas shown on the detailed soil maps are phases of soil series. The name of a soil phase commonly

indicates a feature that affects use or management. For example, Alpha silt loam, 0 to 2 percent slopes, is a phase of the Alpha series.

Some map units are made up of two or more major soils or miscellaneous areas. These map units are complexes, associations, or undifferentiated groups.

A *complex* consists of two or more soils or miscellaneous areas in such an intricate pattern or in such small areas that they cannot be shown separately on the maps. The pattern and proportion of the soils or miscellaneous areas are somewhat similar in all areas. Alpha-Beta complex, 0 to 6 percent slopes, is an example.

An *association* is made up of two or more geographically associated soils or miscellaneous areas that are shown as one unit on the maps. Because of present or anticipated uses of the map units in the survey area, it was not considered practical or necessary to map the soils or miscellaneous areas separately. The pattern and relative proportion of the soils or miscellaneous areas are somewhat similar. Alpha-Beta association, 0 to 2 percent slopes, is an example.

An *undifferentiated group* is made up of two or more soils or miscellaneous areas that could be mapped individually but are mapped as one unit because similar interpretations can be made for use and management. The pattern and proportion of the soils or miscellaneous areas in a mapped area are not uniform. An area can be made up of only one of the major soils or miscellaneous areas, or it can be made up of all of them. Alpha and Beta soils, 0 to 2 percent slopes, is an example.

Some surveys include *miscellaneous areas*. Such areas have little or no soil material and support little or no vegetation. Rock outcrop is an example.

Mecklenburg County, North Carolina

IrB—Iredell fine sandy loam, 1 to 8 percent slopes

Map Unit Setting

Landscape: Uplands
Elevation: 200 to 1,400 feet
Mean annual precipitation: 37 to 60 inches
Mean annual air temperature: 59 to 66 degrees F
Frost-free period: 200 to 240 days

Map Unit Composition

Iredell and similar soils: 85 percent
Minor components: 15 percent

Description of Iredell

Setting

Landform: Interfluves
Landform position (two-dimensional): Summit
Landform position (three-dimensional): Interfluve
Down-slope shape: Linear
Across-slope shape: Linear
Parent material: Saprolite derived from diorite and/or gabbro and/or diabase and/or gneiss

Properties and qualities

Slope: 2 to 8 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Moderately well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: About 12 to 24 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: High (about 10.6 inches)

Interpretive groups

Farmland classification: Farmland of statewide importance
Land capability (nonirrigated): 2e
Hydrologic Soil Group: C/D

Typical profile

0 to 6 inches: Fine sandy loam
6 to 24 inches: Clay
24 to 28 inches: Clay loam
28 to 80 inches: Loam

Minor Components

Sedgefield

Percent of map unit: 8 percent
Landform: Ridges
Landform position (two-dimensional): Summit, footslope
Down-slope shape: Concave
Across-slope shape: Concave

Wynott

Percent of map unit: 4 percent
Landform: Interfluves
Landform position (two-dimensional): Summit
Landform position (three-dimensional): Interfluve
Down-slope shape: Convex
Across-slope shape: Convex

Armenia, undrained

Percent of map unit: 3 percent
Landform: Drainageways on interfluves
Landform position (two-dimensional): Summit
Landform position (three-dimensional): Interfluve
Down-slope shape: Linear
Across-slope shape: Linear

MeB—Mecklenburg fine sandy loam, 2 to 8 percent slopes

Map Unit Setting

Landscape: Uplands
Elevation: 200 to 1,400 feet
Mean annual precipitation: 37 to 60 inches
Mean annual air temperature: 59 to 66 degrees F
Frost-free period: 200 to 240 days

Map Unit Composition

Mecklenburg and similar soils: 85 percent

Description of Mecklenburg

Setting

Landform: Interfluves
Landform position (two-dimensional): Summit
Landform position (three-dimensional): Interfluve
Down-slope shape: Convex
Across-slope shape: Convex
Parent material: Saprolite derived from diorite and/or gabbro and/or diabase and/or gneiss

Properties and qualities

Slope: 2 to 8 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: High (about 9.4 inches)

Interpretive groups

Farmland classification: All areas are prime farmland
Land capability (nonirrigated): 2e
Hydrologic Soil Group: C

Typical profile

0 to 7 inches: Fine sandy loam
7 to 34 inches: Clay
34 to 80 inches: Loam

York County, South Carolina

ArA—Armenia loam, 0 to 2 percent slopes, occasionally flooded

Map Unit Setting

Landscape: Piedmonts
Elevation: 450 to 690 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Armenia, occasionally flooded, and similar soils: 86 percent
Minor components: 14 percent

Description of Armenia, Occasionally Flooded

Setting

Landform: Drainageways
Landform position (two-dimensional): Toeslope
Down-slope shape: Concave, linear
Across-slope shape: Concave, linear
Parent material: Alluvium derived from diabase and/or alluvium derived from gabbro and/or alluvium derived from diorite

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: About 6 to 18 inches
Frequency of flooding: Occasional
Frequency of ponding: None
Available water capacity: Moderate (about 6.5 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 4w
Hydrologic Soil Group: D

Typical profile

0 to 4 inches: Loam
4 to 8 inches: Clay loam
8 to 51 inches: Clay
51 to 80 inches: Clay loam

Minor Components

Worsham, occasionally flooded

Percent of map unit: 14 percent
Landform: Depressions
Landform position (two-dimensional): Toeslope
Down-slope shape: Concave
Across-slope shape: Concave

BbA—Brewback fine sandy loam, 0 to 2 percent slopes

Map Unit Setting

Landscape: Piedmonts, uplands
Elevation: 200 to 1,400 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Brewback and similar soils: 80 percent
Minor components: 20 percent

Description of Brewback

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from gabbro and/or residuum weathered from diorite and/or residuum weathered from diabase

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Somewhat poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: About 6 to 18 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 4.2 inches)

Interpretive groups

Farmland classification: Farmland of statewide importance
Land capability (nonirrigated): 2w
Hydrologic Soil Group: C

Typical profile

0 to 4 inches: Fine sandy loam
4 to 10 inches: Sandy clay loam
10 to 30 inches: Clay
30 to 36 inches: Clay
36 to 80 inches: Weathered bedrock

Minor Components

Iredell

Percent of map unit: 20 percent
Landform: Interfluves
Landform position (two-dimensional): Summit
Landform position (three-dimensional): Interfluve
Down-slope shape: Linear
Across-slope shape: Linear

BbB—Brewback fine sandy loam, 2 to 6 percent slopes

Map Unit Setting

Landscape: Piedmonts, uplands
Elevation: 200 to 1,400 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Brewback and similar soils: 80 percent
Minor components: 20 percent

Description of Brewback

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from gabbro and/or residuum weathered from diorite and/or residuum weathered from diabase

Properties and qualities

Slope: 2 to 6 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Somewhat poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: About 6 to 18 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 4.2 inches)

Interpretive groups

Farmland classification: Farmland of statewide importance
Land capability (nonirrigated): 2w
Hydrologic Soil Group: C

Typical profile

0 to 4 inches: Fine sandy loam
4 to 10 inches: Sandy clay loam
10 to 30 inches: Clay
30 to 36 inches: Clay
36 to 80 inches: Weathered bedrock

Minor Components

Iredell

Percent of map unit: 20 percent
Landform: Interfluves
Landform position (two-dimensional): Summit
Landform position (three-dimensional): Interfluve
Down-slope shape: Linear
Across-slope shape: Linear

CeB2—Cecil sandy clay loam, 2 to 6 percent slopes, moderately eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 400 to 980 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Cecil, moderately eroded, and similar soils: 86 percent
Minor components: 14 percent

Description of Cecil, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from gneiss and/or residuum weathered from granite

Properties and qualities

Slope: 2 to 6 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None

Available water capacity: Moderate (about 6.8 inches)

Interpretive groups

Farmland classification: All areas are prime farmland
Land capability (nonirrigated): 3e
Hydrologic Soil Group: B

Typical profile

0 to 3 inches: Sandy loam
3 to 48 inches: Clay
48 to 80 inches: Sandy clay loam

Minor Components

Cataula, moderately eroded

Percent of map unit: 14 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

CeC2—Cecil sandy clay loam, 6 to 10 percent slopes, moderately eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 400 to 980 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Cecil, moderately eroded, and similar soils: 90 percent
Minor components: 10 percent

Description of Cecil, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from gneiss and/or residuum weathered from granite

Properties and qualities

Slope: 6 to 10 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained

Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 6.8 inches)

Interpretive groups

Farmland classification: Farmland of statewide importance
Land capability (nonirrigated): 4e
Hydrologic Soil Group: B

Typical profile

0 to 3 inches: Sandy loam
3 to 48 inches: Clay
48 to 80 inches: Sandy clay loam

Minor Components

Cataula, moderately eroded

Percent of map unit: 10 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

CfB3—Cecil clay loam, 2 to 6 percent slopes, severely eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 400 to 980 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Cecil, severely eroded, and similar soils: 97 percent
Minor components: 3 percent

Description of Cecil, Severely Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from gneiss and/or residuum weathered from granite

Properties and qualities

Slope: 2 to 6 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 6.1 inches)

Interpretive groups

Farmland classification: Farmland of statewide importance
Land capability (nonirrigated): 4e
Hydrologic Soil Group: B

Typical profile

0 to 1 inches: Sandy loam
1 to 3 inches: Sandy clay loam
3 to 80 inches: Clay

Minor Components

Cataula, moderately eroded

Percent of map unit: 3 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

ChA—Chewacla loam, 0 to 2 percent slopes, frequently flooded

Map Unit Setting

Landscape: Piedmonts, valleys
Elevation: 380 to 610 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Chewacla, frequently flooded, and similar soils: 80 percent
Minor components: 20 percent

Description of Chewacla, Frequently Flooded

Setting

Landform: Flood plains
Landform position (two-dimensional): Toeslope
Down-slope shape: Linear

Across-slope shape: Linear
Parent material: Alluvium

Properties and qualities

Slope: 0 to 2 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Somewhat poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: About 6 to 24 inches
Frequency of flooding: Frequent
Frequency of ponding: None
Available water capacity: High (about 11.3 inches)

Interpretive groups

Farmland classification: Prime farmland if drained and either protected from flooding or not frequently flooded during the growing season
Land capability (nonirrigated): 4w
Hydrologic Soil Group: C

Typical profile

0 to 10 inches: Loam
10 to 80 inches: Sandy clay loam

Minor Components

Riverview, frequently flooded

Percent of map unit: 15 percent
Landform: Flood plains
Landform position (two-dimensional): Toeslope
Down-slope shape: Linear
Across-slope shape: Linear

Wehadkee, inundated

Percent of map unit: 5 percent
Landform: Depressions on flood plains
Down-slope shape: Concave
Across-slope shape: Linear

MeB2—Mecklenburg-Wynott complex, 2 to 6 percent slopes, moderately eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 410 to 960 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Mecklenburg, moderately eroded, and similar soils: 50 percent

Wynott, moderately eroded, and similar soils: 36 percent
Minor components: 14 percent

Description of Mecklenburg, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite

Properties and qualities

Slope: 2 to 6 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 7.6 inches)

Interpretive groups

Farmland classification: Farmland of statewide importance
Land capability (nonirrigated): 3e
Hydrologic Soil Group: C

Typical profile

0 to 4 inches: Sandy loam
4 to 35 inches: Clay
35 to 50 inches: Clay loam
50 to 80 inches: Loam

Description of Wynott, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 2 to 6 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 3.6 inches)

Interpretive groups

Farmland classification: Farmland of statewide importance
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 5 inches: Sandy loam
5 to 21 inches: Clay
21 to 29 inches: Sandy clay loam
29 to 80 inches: Weathered bedrock

Minor Components

Winnsboro, moderately eroded

Percent of map unit: 14 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

MkB3—Mecklenburg-Wynott complex, 2 to 6 percent slopes, severely eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 400 to 980 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Mecklenburg, severely eroded, and similar soils: 50 percent
Wynott, severely eroded, and similar soils: 30 percent
Minor components: 20 percent

Description of Mecklenburg, Severely Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite

Properties and qualities

Slope: 2 to 6 percent
Depth to restrictive feature: More than 80 inches

Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 8.3 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 2 inches: Sandy loam
2 to 26 inches: Clay
26 to 40 inches: Sandy clay loam
40 to 80 inches: Sandy loam

Description of Wynott, Severely Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 2 to 6 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 3.6 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 2 inches: Sandy loam
2 to 26 inches: Clay
26 to 32 inches: Sandy clay loam
32 to 80 inches: Weathered bedrock

Minor Components

Cecil, severely eroded

Percent of map unit: 20 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit

Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

MkC3—Mecklenburg-Wynott complex, 6 to 10 percent slopes, severely eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 400 to 980 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Mecklenburg, severely eroded, and similar soils: 50 percent
Wynott, severely eroded, and similar soils: 30 percent
Minor components: 20 percent

Description of Mecklenburg, Severely Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite

Properties and qualities

Slope: 6 to 10 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 8.3 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 2 inches: Sandy loam
2 to 26 inches: Clay
26 to 40 inches: Sandy clay loam

40 to 80 inches: Sandy loam

Description of Wynott, Severely Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 6 to 10 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 3.6 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 2 inches: Sandy loam
2 to 26 inches: Clay
26 to 32 inches: Sandy clay loam
32 to 80 inches: Weathered bedrock

Minor Components

Cecil, severely eroded

Percent of map unit: 20 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

PaE2—Pacolet sandy clay loam, 15 to 25 percent slopes, moderately eroded

Map Unit Setting

Landscape: Piedmonts

Elevation: 220 to 750 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition
Pacolet, moderately eroded, and similar soils: 95 percent
Minor components: 5 percent

Description of Pacolet, Moderately Eroded

Setting
Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from gneiss and/or residuum weathered from granite

Properties and qualities
Slope: 15 to 25 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 8.2 inches)

Interpretive groups
Farmland classification: Not prime farmland
Land capability (nonirrigated): 7e
Hydrologic Soil Group: B

Typical profile
0 to 2 inches: Sandy loam
2 to 26 inches: Clay
26 to 43 inches: Clay loam
43 to 80 inches: Loam

Minor Components

Hard labor
Percent of map unit: 5 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Linear

PcE3—Pacolet clay loam, 15 to 25 percent slopes, severely eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 220 to 960 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Pacolet, severely eroded, and similar soils: 90 percent
Minor components: 10 percent

Description of Pacolet, Severely Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from gneiss and/or residuum weathered from granite

Properties and qualities

Slope: 15 to 25 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately high to high (0.57 to 1.98 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 7.8 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 7e
Hydrologic Soil Group: B

Typical profile

0 to 1 inches: Sandy clay loam
1 to 26 inches: Clay
26 to 80 inches: Clay loam

Minor Components

Wynott, moderately eroded

Percent of map unit: 5 percent
Landform: Interfluves

Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Linear

Winnsboro, moderately eroded
Percent of map unit: 5 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

W—Water

Map Unit Setting
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition
Water: 100 percent

WbC2—Wynott-Brewback complex, 6 to 10 percent slopes, moderately eroded

Map Unit Setting
Landscape: Piedmonts
Elevation: 410 to 960 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition
Wynott, moderately eroded, and similar soils: 45 percent
Brewback, moderately eroded, and similar soils: 35 percent
Minor components: 20 percent

Description of Wynott, Moderately Eroded

Setting
Landform: Interfluves
Landform position (two-dimensional): Shoulder, backslope
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 6 to 10 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 3.6 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 5 inches: Sandy loam
5 to 21 inches: Clay
21 to 29 inches: Sandy clay loam
29 to 80 inches: Weathered bedrock

Description of Brewback, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Shoulder, backslope
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 6 to 10 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Somewhat poorly drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: About 6 to 18 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 4.4 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 2 inches: Sandy loam
2 to 9 inches: Sandy clay loam
9 to 36 inches: Clay
36 to 38 inches: Sandy clay loam
38 to 80 inches: Weathered bedrock

Minor Components

Winnsboro, moderately eroded

Percent of map unit: 20 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

WmD2—Wynott-Mecklenburg complex, 10 to 15 percent slopes, moderately eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 410 to 960 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Wynott, moderately eroded, and similar soils: 45 percent
Mecklenburg, moderately eroded, and similar soils: 40 percent
Minor components: 15 percent

Description of Wynott, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 10 to 15 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 3.6 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 6e
Hydrologic Soil Group: C

Typical profile

0 to 5 inches: Sandy loam
5 to 21 inches: Clay
21 to 29 inches: Sandy clay loam
29 to 80 inches: Weathered bedrock

Description of Mecklenburg, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite

Properties and qualities

Slope: 10 to 15 percent
Depth to restrictive feature: More than 80 inches
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Moderately low to moderately high (0.06 to 0.20 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 7.6 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 6e
Hydrologic Soil Group: C

Typical profile

0 to 4 inches: Sandy loam
4 to 35 inches: Clay
35 to 50 inches: Clay loam
50 to 80 inches: Loam

Minor Components

Winnsboro, moderately eroded

Percent of map unit: 15 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

WwE2—Wynott-Wilkes complex, 15 to 25 percent slopes, moderately eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 410 to 960 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Wynott, moderately eroded, and similar soils: 55 percent
Wilkes, moderately eroded, and similar soils: 40 percent
Minor components: 5 percent

Description of Wynott, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 15 to 25 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 3.6 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 7e
Hydrologic Soil Group: C

Typical profile

0 to 5 inches: Sandy loam
5 to 21 inches: Clay
21 to 29 inches: Sandy clay loam
29 to 80 inches: Weathered bedrock

Description of Wilkes, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 15 to 25 percent
Depth to restrictive feature: 10 to 20 inches to paralithic bedrock; 40 to 72 inches to lithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Very low (about 2.7 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 7e
Hydrologic Soil Group: C

Typical profile

0 to 4 inches: Sandy loam
4 to 15 inches: Sandy clay loam
15 to 18 inches: Sandy loam
18 to 45 inches: Weathered bedrock
45 to 80 inches: Unweathered bedrock

Minor Components

Winnsboro, moderately eroded

Percent of map unit: 5 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

WyB2—Wynott-Winnsboro complex, 2 to 6 percent slopes, moderately eroded

Map Unit Setting

Landscape: Piedmonts
Elevation: 410 to 960 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Wynott, moderately eroded, and similar soils: 55 percent
Winnsboro, moderately eroded, and similar soils: 30 percent
Minor components: 15 percent

Description of Wynott, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 2 to 6 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 3.6 inches)

Interpretive groups

Farmland classification: Farmland of statewide importance
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 5 inches: Sandy loam
5 to 21 inches: Clay
21 to 29 inches: Sandy clay loam
29 to 80 inches: Weathered bedrock

Description of Winnsboro, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 2 to 6 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 6.1 inches)

Interpretive groups

Farmland classification: Farmland of statewide importance
Land capability (nonirrigated): 3e
Hydrologic Soil Group: C

Typical profile

0 to 4 inches: Sandy loam
4 to 25 inches: Clay
25 to 32 inches: Sandy clay loam
32 to 52 inches: Sandy loam
52 to 80 inches: Weathered bedrock

Minor Components

Mecklenburg, moderately eroded

Percent of map unit: 15 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder, summit
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear

WyC2—Wynott-Winnsboro complex, 6 to 10 percent slopes, moderately eroded

Map Unit Setting

Landscape: Piedmonts

Elevation: 410 to 960 feet
Mean annual precipitation: 42 to 55 inches
Mean annual air temperature: 51 to 72 degrees F
Frost-free period: 202 to 249 days

Map Unit Composition

Wynott, moderately eroded, and similar soils: 55 percent
Winnsboro, moderately eroded, and similar soils: 35 percent
Minor components: 10 percent

Description of Wynott, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 6 to 10 percent
Depth to restrictive feature: 20 to 40 inches to paralithic bedrock
Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Low (about 3.6 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 5 inches: Sandy loam
5 to 21 inches: Clay
21 to 29 inches: Sandy clay loam
29 to 80 inches: Weathered bedrock

Description of Winnsboro, Moderately Eroded

Setting

Landform: Interfluves
Landform position (two-dimensional): Backslope, shoulder
Landform position (three-dimensional): Interfluve, side slope
Down-slope shape: Convex
Across-slope shape: Linear
Parent material: Residuum weathered from diorite and/or residuum weathered from gabbro

Properties and qualities

Slope: 6 to 10 percent
Depth to restrictive feature: 40 to 60 inches to paralithic bedrock

Drainage class: Well drained
Capacity of the most limiting layer to transmit water (Ksat): Very low to moderately low (0.00 to 0.06 in/hr)
Depth to water table: More than 80 inches
Frequency of flooding: None
Frequency of ponding: None
Available water capacity: Moderate (about 6.1 inches)

Interpretive groups

Farmland classification: Not prime farmland
Land capability (nonirrigated): 4e
Hydrologic Soil Group: C

Typical profile

0 to 4 inches: Sandy loam
4 to 25 inches: Clay
25 to 32 inches: Sandy clay loam
32 to 52 inches: Sandy loam
52 to 80 inches: Weathered bedrock

Minor Components

Wilkes, moderately eroded

Percent of map unit: 10 percent
Landform: Interfluves
Landform position (two-dimensional): Backslope
Landform position (three-dimensional): Side slope
Down-slope shape: Convex
Across-slope shape: Linear

18 years Professional Experience

Mr. Grant is the manager of the assessment and remediation division of our South Carolina office and the office's emergency response team. During his career, he has completed a wide range of multi-media assessments from simple to complex. Based upon the results of these assessments, Mr. Grant has designed and implemented site-specific remediation systems for the sites, when needed. Remedial technologies include dual phase extraction, enhanced bioremediation, bioventing, air sparge/vapor extraction, and chemical oxidation. Mr. Grant also heads the company-wide PCB work group. His principal strength is understanding State and Federal regulations and how they relate to the needs of our clients. The following highlights some of his experience related to your needs.

ENVIRONMENTAL ASSESSMENT AND REMEDIATION

Mr. Grant has conducted and/or directed a wide variety of environmental assessments. Representative projects include:

Columbia, SC: Project manager for the Phase I/II ESA and remediation of an industrial property containing 51 55-gallon drums and 31 5-gallon buckets of unidentified waste and metals contaminated soils. The unknown waste was characterized and properly disposed of and the metals contaminated soils were excavated to allow the closing to occur for the real estate transaction.

North Charleston, SC: Responded to an overturned petroleum tanker truck that ruptured, releasing over 8,000 gallons of petroleum product onto the I-526 West on-ramp and subsequently into Filbin Creek and its associated salt marsh. Oversaw an inter-agency spill response and clean-up effort designed to keep bulk product from impacting the nearby Cooper River.

Brookneal, VA: Project manager for the assessment of the extent of the free and dissolved phase petroleum hydrocarbon plume from two petroleum releases at the site. Oversaw the hook up of several residences and businesses with private water supply wells to the municipal water. Designed and implemented a dual phase extraction remediation system to remove the free phase petroleum product from the subsurface.

Johns Island, SC: Lead scientist in the preparation of documents used for drafting of a Voluntary Cleanup Contract (VCC) for the Former Trident Landfill, Johns Island, SC. Performed site reconnaissance of landfill cap conditions and potential groundwater contaminant migratory pathways. Conducted a soil vapor and groundwater assessment along the adjacent property boundary to assess whether methane and/or groundwater contaminants had impacted the property prior to the property's proposed development.

Irmo, SC: Project manager for the emergency spill response for a leaking high concentration PCB transformer and the assessment of the extent of the PCB contamination. Achieved a solution within the USEPA PCB regulations that allowed the client to continue to use their property without interuption.

Rustburg, VA: Project manager for the assessment of the extent of the free and dissolved phase petroleum hydrocarbon plumes from a petroleum release at the site. Conducted fate and transport modelling of the dissolved phase petroleum plume to determine remedial endpoints. Designed and implemented a dual phase extraction remediation system to remove the free phase petroleum product from the subsurface. Remedial endpoints achieved in June 2009.

Summerville, SC: Project manager for litigation support for a lawsuit between a private property owner and the responsible party/State of South Carolina. Sale of the property was halted due to the discovery of dissolved phase petroleum hydrocarbons in the groundwater on the property.

West Columbia, SC: Team scientist on an assessment of a former transformer storage area within a former utility company crew quarters. Conducted a multi-media assessment to assess the vertical and horizontal extent of the PCB contamination. Consulted with the client about remedial options for the contamination. Calculated the volume of materials necessary to remediate the site under a performance-based remediation prior to the sale of the property.

1 Introduction

Fuss & O'Neill, Inc. was retained by STV, Inc., to conduct a Phase II Environmental Site Assessment (ESA) in conjunction with a South Carolina Department of Transportation (SCDOT) road widening and right-of-way (ROW) expansion along U.S. Highway 21 and S.C. Highway 51 in York County, South Carolina. STV, under a York County "Pennies for Progress"/ SCDOT contract has designed and will manage construction of the project. The objectives of this ESA are to determine whether releases of hazardous substances or petroleum products have occurred associated with "recognized environmental conditions" (RECs) identified in a Limited Phase I ESA, prepared by Fuss & O'Neill, Inc. dated June 18, 2013. This Phase II ESA was performed as part of STV's and the SCDOTs due diligence as outlined in SCDOTs *Environmental Reference Document* (revision 2008) Section 6.2.7(e). It is the SCDOT's policy to avoid the acquisition of underground storage tanks and other hazardous materials, if possible.

Nine (9) properties that possessed RECs were identified during the Limited Phase I ESA conducted in 2013. Fuss & O'Neill identified the following sites as having RECs in the Limited Phase I ESA:

- Millers Produce & Farm (3660 SC Highway 51) – Petroleum leaking underground storage tank (LUST) site and currently operates as a petroleum retailer;
- Summerville Grocery (SC Highway 51) – Petroleum LUST site and petroleum retailer;
- Lords Armory (3578 SC Highway 51) – Petroleum LUST site;
- Partex / Eumeric Holdings (3551 SC Highway 51) – known to have had chromium contaminated soil; violations of the South Carolina (SC) Hazardous Waste Management Regulations and SC Pollution Control Act; and, non-compliance with administrative order issued by SC Department of Health and Environmental Control (SCDHEC);
- Paving Equipment of the Carolinas (3550 SC Highway 51) – formerly stored #2 fuel oil and manufactured petroleum-based asphalt;
- Southern Tree & Landscaping (Intersection US 21 / SC 51) – presence of on-site monitoring well network and limited available information;
- Handy Pantry 28 Food Mart (3004 US Highway 21 Bypass) – Petroleum LUST site;
- T&G Country Store (2976 US Highway 21) – Petroleum LUST site; and,
- Times Turn Around 10 (2488 Highway US 21 Bypass) – Petroleum LUST site and currently operates as a petroleum retailer.

Additional investigation revealed that the sites identified as Millers Produce & Farm and Summerville Grocery are the same parcel, but there are different responsible parties for the release of petroleum into the subsurface at the site. Although Southern Tree & Landscaping was within the search radius of the Limited Phase I ESA, this site was eliminated from requiring additional assessment during the Phase II ESA because no lands associated with the Southern Tree & Landscaping site will be acquired during this road-widening project. Therefore, seven (7) parcels require further investigation under this scope of work. These remaining seven (7) parcels will be referred to as Areas of Concern (AOCs) for the remainder of the report.

This assessment allows the potential property acquirer (i.e., SCDOT) to determine if environmental conditions exist that indicate an existing release, a past release, or a material threat of a release of petroleum products or hazardous materials into the vadose zone soils or groundwater in the vicinity of the proposed road widening and ROW expansion.

It should be noted that no ESA could wholly eliminate uncertainty regarding the potential for RECs in connection with a property or properties. This assessment was performed in conformance with ASTM E1903-11 (2011) *Standard Practice for Environmental Site Assessments: Phase II ESA Process* and SCDOTs *Environmental Reference Document* Section 6.2.7(e) (2008). The Phase II Environmental Site Assessment process is designed to reduce, but not eliminate, uncertainty regarding the RECs about the property within reasonable time and costs constraints.

2 Introduction

This section provides a summary of the information used to construct the initial conceptual model for the Site, which, in turn, guided the investigations. Information such as the Site's operational history, geology, hydrogeology, and potential receptors help identify areas where releases of hazardous materials could occur and how they might impact human health and the environment.

2.1 Physical Description

The US Highway 21/SC Highway 51 road-widening project is located north of downtown Fort Mill between Springfield Parkway and the North Carolina/South Carolina state line (*Figure 1*). The project corridor has a linear roadway distance of approximately 13,200 feet. The proposed limits of construction for this project will require acquisition of additional ROW.

The corridor is located in an area of mixed residential, industrial, and commercial parcels. A site location map showing the approximate project corridor is provided as *Figure 1* and site sample location maps are included as *Figures 2 through 4*.

Site Utilities

The City of Fort Mill and York County provides municipal water and sewer service in the area to the property. Duke Energy provides electrical power to the corridor. Electric, cable, and telephone services to the corridor are provided via a combination of underground conduits and overhead transmission lines.

2.2 Physiographic Setting

According to the topographic maps reviewed for this assessment, the corridor and surrounding area ranges from approximately 590 feet to 650 feet above mean sea level (MSL). Topography of the corridor site generally slopes south to southeast towards tributaries of the Blackmanship Branch, Steele Creek, and Sugar Creek. These creeks each ultimately discharge into the Catawba River.

2.3 Environmental Setting

2.3.1 Geology

According to the *Geologic Notes, Volume 9, Number 2* (State Development Board, June 2010), York County is situated in the north-central Piedmont of South Carolina, adjacent to the North Carolina state line. Rocks of the Piedmont occur in belts that conform to the regional-northeasterly trend of major structural features. The belts are delineated by gross differences in rock types, grade of metamorphism, and structure. York County straddles the Charlotte Belt and extends into the Carolina Slate Belt to the east and into the Kings Mountain Belt to the northwest.

Rocks of the Carolina Slate Belt are mainly low rank metamorphic rocks of sedimentary and volcanic origin. The Charlotte Belt includes medium- to high-rank metamorphic rocks and a complicated sequence of igneous intrusions. Major rock types of the Kings Mountain Belt are phyllite, schist, gneiss, quartzite, conglomerate, and marble. The metamorphic grade of the Kings Mountain Belt ranges from medium to low.

2.3.2 Hydrology & Hydrogeology

The soils encountered in this area are the residual product of in-place chemical weathering of rock presently underlying the site. In general, shallow unconfined groundwater movement within the overlying soils is controlled largely by topographic gradients. However, as the groundwater percolates downward to the bedrock, it becomes controlled by the orientation of the rock fracture systems. Thus, the direction of groundwater movement may not be consistent with the reflection topography.

Recharge occurs primarily by infiltration along higher elevations and typically discharges into streams or other surface water bodies. The elevation of the shallow water table is transient and can vary with seasonal fluctuations in precipitation. Movement of groundwater under water table conditions is generally from higher to lower elevations. As such, shallow groundwater at the subject site appears to move to the south and southeast towards lower elevations and off-site water bodies.

Based on USGS mapping and field observations of the local topography regarding the physical setting, the groundwater flow direction of the corridor appears to vary throughout the corridor. The inferred dominant groundwater flow direction along the project corridor appears to be to the south/southeast toward tributaries of Sugar Creek and the Sugar Creek. Groundwater along the project corridor is believed to vary from 5 feet to 60 feet below ground surface based on elevations of nearby water bodies.

The corridor is located west of Sugar Creek, which discharges to the Catawba River. Surface runoff from the site would appear to flow to the south/southeast toward Sugar Creek and its tributaries, with components of flow to the southwest towards Blankmanship Branch, which discharges to Steele Creek and eventually discharges to Sugar Creek.

2.4 Phase II Areas of Concern

The following is a description of the AOCs that were identified in the Fuss & O'Neill's Limited Phase I ESA and were investigated as part of this Phase II ESA. Maps displaying the locations of the listed AOCs are included as *Figures 2 through 4*.

Millers Produce & Farm / Summerville Grocery

The Millers Produce & Farm and Summerville Grocery refer to the same parcel, but there are different responsible parties for the distinct releases of petroleum into the subsurface at the site. Due to the limited available information pertaining to this site, its current operation as a fuel retailer, and known releases of petroleum on the site, this site is an AOC during this Phase II ESA.
